**Survey Date**  
**April 12, 2010**

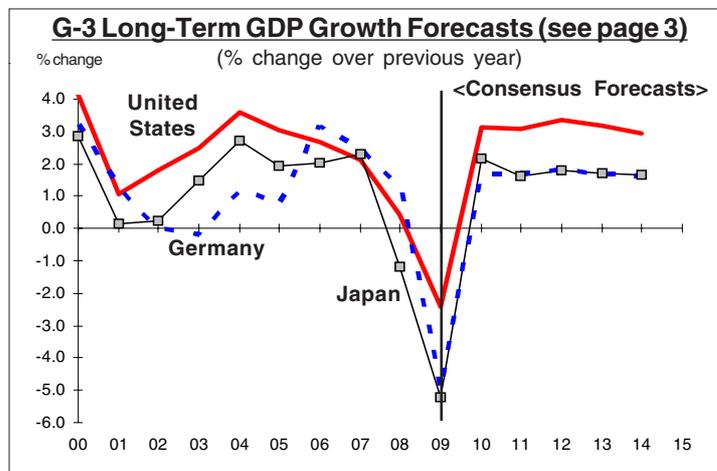

Every month, Consensus Economics surveys over 240 prominent financial and economic forecasters for their estimates of a range of variables including future growth, inflation, interest rates and exchange rates. More than 20 countries are covered and the reference data, together with analysis and polls on topical issues, is rushed to subscribers by express mail and e-mail.

## Survey Highlights

- ◆ This month's special survey is our regular compilation of **Long-Term Forecasts** (pages 2, 3, 28, and 29), with revised consensus expectations for the next 5-10 years.
- ◆ An unexpected bout of bad weather across Western Europe at the start of the year may have contributed to a slowdown in activity. Retail sales were particularly affected, with many countries posting large monthly declines in January. Nonetheless, the OECD expects most of the G-7 economies to expand in Q1 2010, with the **UK** and **Canada** setting the pace. **Germany**, however, could be the exception and initially contract before bouncing back in Q2.
- ◆ The events in **Greece** have turned the spotlight on other high-deficit countries trying to get to grips with their finances. Spending cuts are being prepared with added urgency in **Spain**, while the deficit has been pushed to the forefront of the election campaign in the **UK**. The mixed start to the year for many economies, however, makes it unclear as to whether growth across Western Europe would be strong enough to survive the necessary withdrawal of government stimulus this year.

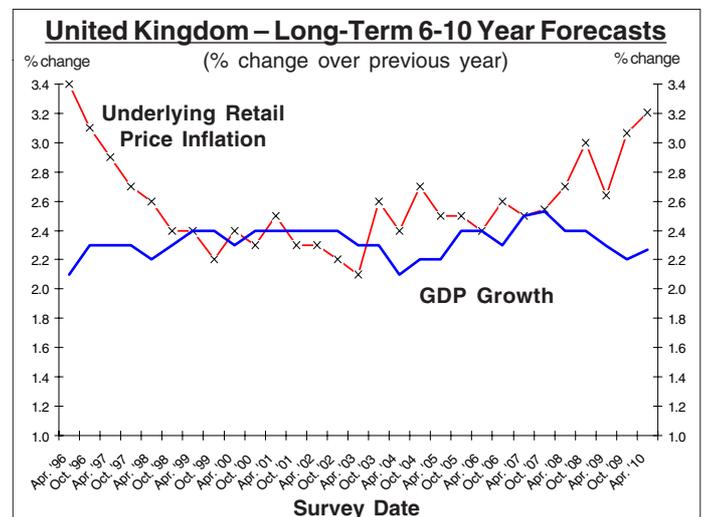

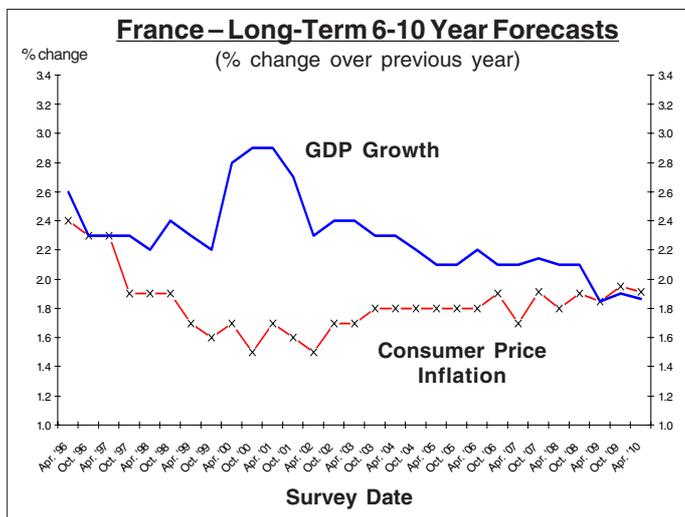

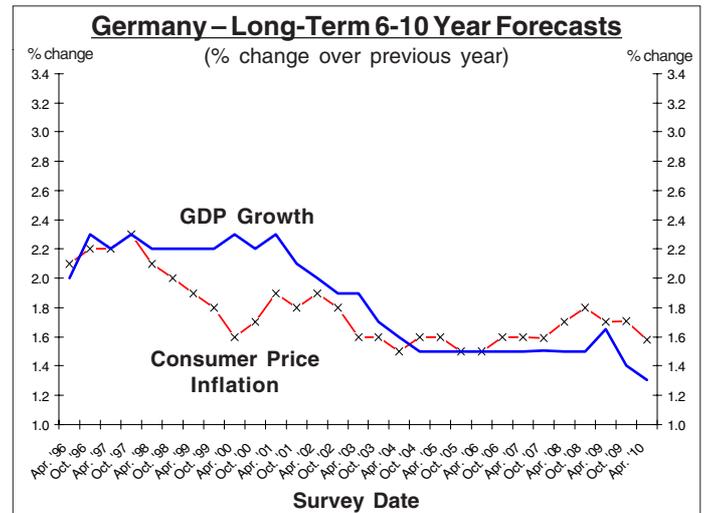

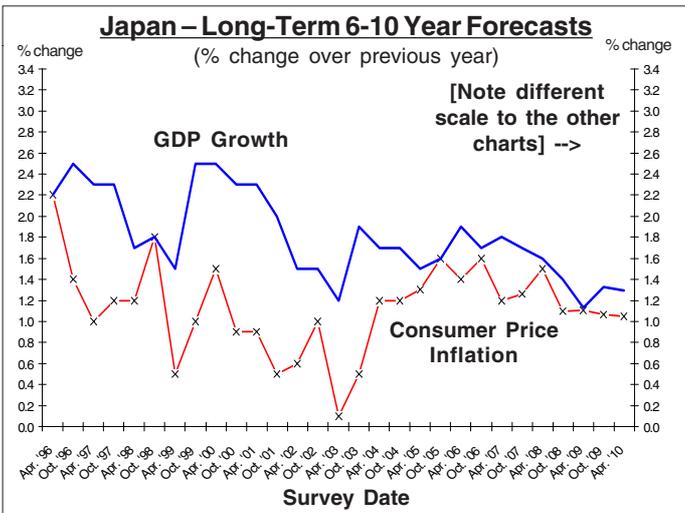

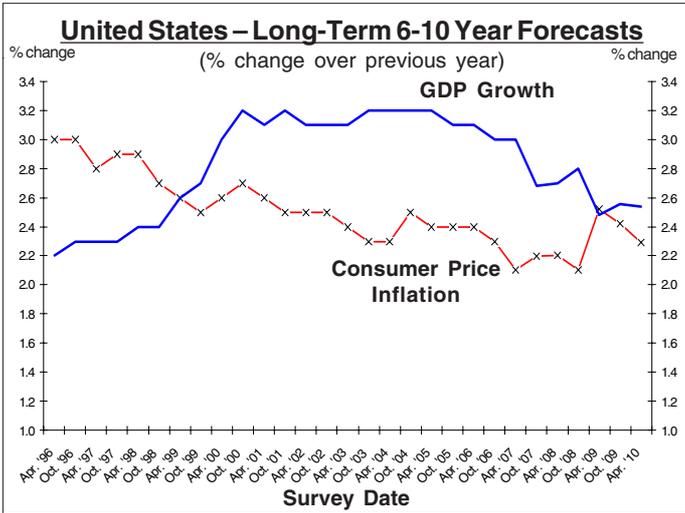

Our next issue of **Consensus Forecasts** will be available by the end of the day on **May 13** and will include forecasts for **Corporate Profits** and **10-Year Real Interest Rates**.

This month, we explore **Significant Changes in Long-Term Forecast Trends for GDP and Inflation for the US, Japan, Germany, France and the UK**. Long-term projections for the 6-10 year aggregate period (in this case 2016-2020) are contrasted with those long-term aggregates published all the way back to April 1996. It is this rolling 6-10 year trendline average which we show in the charts below. The forecast data for **Long-Term GDP growth and Inflation for all countries surveyed** are also shown on pages 3, 28 and 29.

We collect the consensus mean forecast for each of the next five years individually and then as a trendline average for years 6-10. These 6-10-year trend averages shown in the charts are a measure of changes in potential growth and inflation expectations. This construct has two problems, however. One is that the 6-10 year horizon is a moving target shifting forward one year, each year. The other is that the number of panellists responding to our long-term surveys is always smaller and therefore less representative than the numbers responding to our one and two-year surveys on pages 4-24. As the charts illustrate, the **UK** is the only country which has seen its long-term aggregate for GDP growth tick upwards. However, this has been accompanied by a noticeable expansion in the RPIX inflation outlook, adding to the worries already troubling British policymakers, such as the massive budget deficit. **Germany** presents a downbeat view of the medium-term, reflecting unfavourable demographics and other structural challenges. As in the **UK**, the long-term inflation trend is expected to outstrip the muted GDP outlook. This has not been helped by the recent fiscal crisis engulfing Greece and other southern European countries which is also endangering the public sector's ability to cover generous pensions and welfare handouts. **US** GDP projections have stabilised, but the overall trend is still down from the productivity-fuelled expansion at the beginning of the decade.

See pages 3, 28 and 29 for data and page 30 for "Notes and Abbreviations."

In addition to their regular forecasts, country panellists were asked to provide longer-term forecasts covering the period until 2020 for growth in real GDP, consumer spending, investment and industrial production, along with consumer price inflation, current account balances and long-term bond yields. All definitions correspond to those used in the individual country pages.

**Long-Term Forecasts** for the **G-7** and **Western Europe** indicate that it will take some time before some countries return to pre-crisis rates of growth after last year's traumatic recession. The **US** and **Canada** are among the exceptions, with the **US** likely to see a 3.2% rebound in GDP this year and maintain an optimum growth rate of +3.0% over the next four years. Individual sectors of the economy will take longer to extricate themselves from last year's massive drop in output, however, and this is reflected in a noticeably more modest rebound in 2010 consumption and investment. A revival in productivity on the back of the current cycle of job layoffs should support the medium-term growth trend, although the longer-term outlook has moderated. Of lingering concern is the sizeable current account deficit, which shows little sign of narrowing through to 2020. This illustrates the country's private debt burden which is, in turn, outstripped by an enormous Federal fiscal deficit. Both could take generations to pay down and will act as an additional dampener on GDP fundamentals. Meanwhile, **Canada's** resilience is reflected in

strong medium-term forecasts for spending, investment and production as well as GDP. Western European forecasts are, by contrast, muted, reflecting structural challenges such as the aging workforce and widening pensions overhang. **Spain** is expected to suffer the weakest performance of all economies surveyed over the next three years, contracting for a second consecutive year in 2010 and averaging only 1.3% growth in 2011-2012. A worryingly large fiscal shortfall and looming austerity measures are expected to rein in output further. **Italy** has already posted a quarter of growth after GDP declined by 5.1% in 2009, but the economy is not expected to hover far from the 1%-mark over the next 5-10 years. Even **Germany** and **France** are not projected to touch 2% GDP growth over the current forecast horizon. Meanwhile, **Japan** – which suffered the deepest contraction last year of all countries surveyed – is likely to see a 2.2% rebound this year although that growth rate is unlikely to be maintained over the rest of the forecast horizon.

**Recovery Spreads from Industry to Other Sectors**

Payroll employment finally registered a significant gain of 162,000 jobs, its best monthly showing in more than two years. In addition, revisions to the data over previous months indicated that 62,000 more jobs were added to the economy than previously thought. The news suggests that the private sector finally feels confident enough in the recovery to begin tentatively hiring again. While the jobs market does indeed appear to have turned a corner, it remains soft in comparison with the cyclical highs of the previous expansion. Detractors point to the fact that unemployment is unchanged at 9.7% for the third consecutive month. However, our panel's forecasts for this variable continue to trend downward. Elsewhere, real personal expenditure picked up from 0.2% (m-o-m) in January to 0.3% the following month, with upbeat auto sales underscoring the gradual strengthening in consumer activity. Even the housing market is starting to exhibit some improvement. Personal consumption expectations have risen while, in turn, the consensus for 2010 GDP growth has edged up on the back of both domestic demand and industry.

While it is clear that the economic turnaround continued in Q1, uncertainty still hangs over the course of policy. This has been highlighted by divisions among Fed policymakers over the outlook for the CPI. Low interest rates have sparked fears of higher inflation over the medium-term, but some have suggested that inflation could slow further. Indeed, headline consumer prices were flat m-o-m in February and rose by only 0.1% in March. Meanwhile, core PCE prices remained flat in February, while the annual rate stood at 1.3%. CPI forecasts are tracking downward as a result, and our panel predicts that inflation will moderate going into 2011, too.

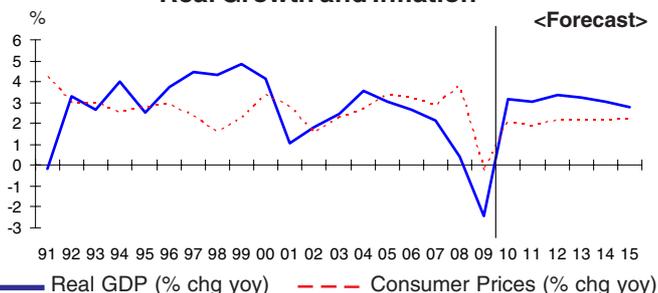

**US Fed Funds Rate** – April 12, 2010 = between 0%-0.25%

**March Tankan Suggests Stronger Corporate Sector**

The Tankan survey for the March quarter showed a broad improvement in corporate sentiment since the start of the recovery. Marking a fourth straight gain, the diffusion index for large manufacturers rose to -14 from -25 in the December survey, while a similar increase was recorded for non-manufacturing firms, too. Furthermore, although most firms envisage small cuts to investment in FY10/11, profit projections for the period have turned positive. It is hoped that the improving corporate backdrop and, in particular, higher profits can filter through to wages and support flagging consumption going forward. Total cash earnings in February extended a downward slide of 0.6% from a year earlier, and in the same month real household spending unexpectedly declined by 0.5% (y-o-y). Elsewhere, industrial production faltered m-o-m in February (most likely due to seasonal effects) for the first time in almost a year. Similarly, exports decreased by 1.7% over the month but a 45.3% y-o-y expansion signalled the fastest growth in over 30 years. In addition, the February merchandise trade surplus of ¥651.0tn was nine times higher than the surplus logged at the same time last year. Given ongoing signs of recovery, the consensus for real GDP growth has risen to 2.2% this month.

Deflation moderated slightly in February after core consumer prices declined by 1.2% (y-o-y), compared with a 1.3% fall in January. Prices could head lower in the coming months after the government eliminated high school tuition fees, in line with its election pledge. In response to persistent deflationary pressures, the Bank of Japan extended its program for commercial lenders to ¥20tn in March in a bid to reduce borrowing costs and spur growth and prices.

**Contraction on the Cards in Q1 2010?**

After the recovery unexpectedly stagnated at the end of last year, there are now fears that the economy could contract in Q1 2010 as a prolonged period of bad weather caused activity to slow. Retail sales were down by 0.5% (m-o-m) in January and by 0.4% in February, while industrial production – the main driver of GDP in previous quarters – managed only a 0.1% (m-o-m) rise in January and stagnated in February. Consequently, the OECD expects the economy to contract by 0.4% (q-o-q annualised) in Q1 in contrast with other G-7 nations which are projected to expand. Business confidence surveys indicate that growth should return in Q2, however. The PMI for manufacturing rose from 57.2 in February to 60.2 in March, the highest level in the region and consistent with a return to rapid growth in the sector, while the services index rose to 54.9. Though German industries are benefiting from the depreciation of the euro following the Greek fiscal crisis, the ongoing threat of further bailouts in southern Europe could be problematic as without a swift resolution, demand in valuable inter-European export markets could dry up. Meanwhile, March inflation jumped by 0.5% (m-o-m) and 1.1% (y-o-y) as the combined result of the depreciating currency, rising energy costs and bad weather.

The German labour market is once again proving resilient in testing times as the number of registered unemployed saw a further decline in February, with claims falling by 31,000 on the month before. This leaves the overall rate at 8.1%, well below the Euro zone average which passed 10% in the same month. Increased job flexibility appears to be paying off, and our panel has downgraded its forecast for the unemployment rate this year to 8.4%.

**Manufacturing, Not Consumption, Starts to Drive Activity**

The final release of the Q4 2009 national accounts confirmed the acceleration in GDP evidenced in the preliminary report, from 0.2% (q-o-q) in Q3 to 0.6%. GDP was lifted by inventories and a 2.0%-point contribution from domestic final sales, but net trade subtracted from activity. Going into 2010, the main impetus of activity appears to be shifting away from domestic demand and towards industry. Manufacturing orders rose by 1.0% (m-o-m) in January on the back of a 3.4% surge in exports, underscoring the comparative softness of domestic activity. Elsewhere, manufacturing production continued to rise after a 0.6% (m-o-m) gain in February, reaching 0.4% in March which brought the y-o-y rate up from 3.6% to 4.6%. With March's purchasing managers' index (PMI) for the sector rising from 54.9 in the previous month to 56.5 and INSEE's own survey of industrialists also recording gains, manufacturing is expected to pick up further in the months ahead. Our panel's production forecast for 2010, however, remains unchanged at 3.0% this month.

By contrast, March's services PMI fell back, once again highlighting the shakiness outside of industry. With employment contracting in the final quarter of 2009 and the jobless rate standing at 9.6% – not to mention the gradual phasing out of last year's successful car scrappage scheme – 2010 consensus forecasts for household spending remain at 1.0%. Indeed, retail trade declined in m-o-m terms in January. Meanwhile, spending on durable goods in February registered a 1.2% monthly fall, its second consecutive contraction, which leaves spending in the first two months of 2010 down from the December quarter. 2011 consumption is not expected to accelerate significantly either.

**Expansion Could Continue into Q1**

Early indicators suggest that despite the VAT hike and bad weather in January putting an initial dampener on activity, the economy managed to avoid a dreaded “double-dip” recession and continued on a path of expansion in Q1. Retail sales, for example, rebounded by 2.1% (m-o-m) in February, overcoming much of the previous month’s slump, while the PMI for manufacturing reached a new high of 57.2 in March. In its latest interim assessment, the OECD even said that it expected the UK economy to grow the fastest out of all the G-7 countries bar Canada in the first half of the year, forecasting a q-o-q annualised growth rate of 2.0% in Q1 and 3.1% in Q2. The labour market appears to be indicative of this turnaround in fortunes, as new hirings in February were up and the claimant count of unemployment fell by 32,300. A cause of concern, however, is that the number of those deemed “economically inactive” has risen to its highest level in years, with the proportion of those employed falling to 58.1%. Meanwhile, inflation surprised on the downside in February as it fell to 3.0% (y-o-y) from a high of 3.5% in January. This suggests that the upside risk to inflation could be dissipating, allowing monetary policy to stay looser for a little longer (until the final quarter of this year according to our panel – see below).

It was finally confirmed that the next general election will take place on May 6<sup>th</sup>. Investors will be hoping for a clear victor to emerge so that steps to grapple with the spiralling deficit can finally be undertaken. In the meantime, the revised government estimate of the FY2009-10 budget deficit from £178bn to £167bn did little to reassure the markets, as the UK pound made further losses against the US dollar.

**Fragile Recovery**

Revisions to the Italian national accounts have further highlighted the fragility of the recovery. The unexpected contraction in Q4 2009 GDP was larger than originally thought, posting a 0.3% (q-o-q) fall compared with the initial 0.2% estimate, while Q3 growth – which initially brought Italy out of recession – was revised down slightly from 0.6% to 0.5%. The contraction seen for the year as a whole was amended to 5.1% from an original 4.9% estimate. The poor performance at the end of last year was driven by slumps in consumer spending and investment, which fell by 0.1% (q-o-q) and 1.0%, respectively. Nevertheless, going forward, manufacturing appeared to recover at the turn of the year, with industrial production jumping by a large 2.6% (m-o-m) in January on the back of an increase in exports. Indeed, the IMF anticipates that it will be external demand which drives future growth while consumer spending remains subdued. A rapid rise in joblessness appears to be the source of consumer caution, as in February when unemployment reached 8.5% after posting an average of 8.2% in the last three months of 2009. In a bid to shore up domestic demand, the government recently passed a consumer-targeted stimulus measure worth €300mn in order to encourage the sale of durable goods.

After resisting the temptation to lower taxes to stimulate growth, the government budget is expected to post a relatively modest deficit of 5.3% of GDP in 2009 and aims to cut this down to 3.9% in 2011. This puts Italy in a better position than the likes of Spain, Portugal and Greece, although weak growth prospects in the near-term remain an issue for credit rating agencies considering downgrades.

**Canadian Outlook Surges Ahead of its G-7 Counterparts**

Output-based GDP picked up from 0.5% (m-o-m) in December to 0.6% in January, its fifth consecutive rise. Moreover, the y-o-y rate finally emerged from recession, rising by 1.3%, which bodes well for activity in Q1 as a whole. GDP was lifted by a 1.3% monthly increase in goods-producing industries. Manufacturing, in particular, jumped by 1.9% (m-o-m) as the result of a 2.1% surge in durables, while industrial production as a whole accelerated by 1.3%. Elsewhere, factory sales registered a strong January showing of 2.4% over the previous month. This was far above initial expectations and, coupled with a 2.2% monthly increase in shipments, underscores the turnaround evidenced in industry. Indeed, our panel's production forecast for 2010 has been noticeably upgraded again this month, from 3.7% to 5.3%, while GDP expectations have jumped past the 3%-mark to 3.2%.

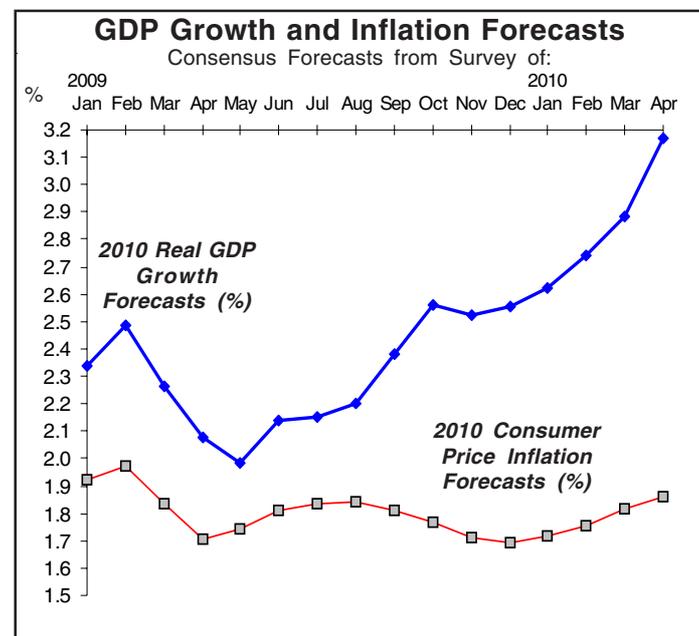

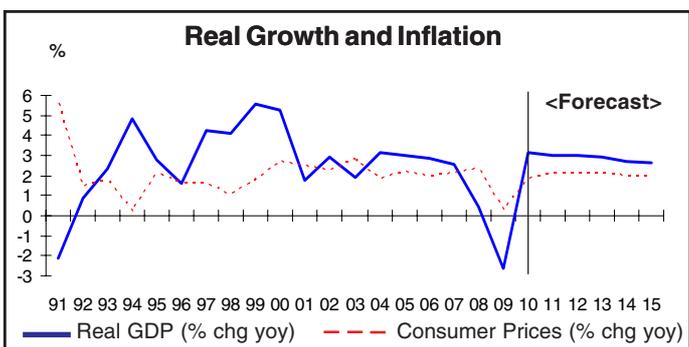

Personal expenditure weathered the worst of the recession in 2009 by managing to avoid an outright contraction. Going into 2010, consumption has been supported by resilient job market fundamentals. Unemployment, for example, stayed at 8.2% in March while payrolls have been registering gains for a while now. This has helped 2010 consensus expectations for the jobless rate to edge down. The concerted advance in activity has also increased attention on the Bank of Canada's forthcoming policy moves. The overnight lending rate remains at negligible levels, but the accelerating pace of growth is likely to prompt a rate hike by the summer (see box, below). February headline consumer price increases, however, remain below the bank's 2% target while core inflation saw a modest uptick to 2.1%. Headline expectations for the year as a whole remain within target.

**Canada Overnight Lending Rate – April 12, 2010 = 0.25%**

**Backward-Looking Data Gloomy**

The ECB kept its target rate unchanged on April 8 for the eleventh consecutive month. Despite inflation spiking at 1.5% (y-o-y) in March (from 0.9% in February), the ECB indicated that interest rate levels were appropriate considering the current economic environment. Data show the pace of the recovery is slowing and sentiment has been further hit by Greece's fiscal crisis. Q4 GDP was revised down from 0.1% (q-o-q) to zero growth, while unemployment edged up from 9.9% in January to break the 10%-mark the following month. February retails sales fell again, by 0.6% (m-o-m), as the result of faltering confidence. On the upside, the March PMI for manufacturing underscored a relatively upbeat outlook for industry. 2010 production forecasts have soared.

**Euro Zone Interest Rates**

Forecasts are provided by a total of more than 80 panelists for **Germany** (page 9), **France** (page 11), **Italy** (page 15), the **Netherlands** (page 20) and **Spain** (page 22). This allows the analysis of forecasts for different yields on individual country 10-year benchmark bonds. Forecasts for 3-month interest rates are all for the EURIBOR rate.

**Euro Exchange Rates**

Forecasts are provided by more than 100 panellists and are shown on page 27.

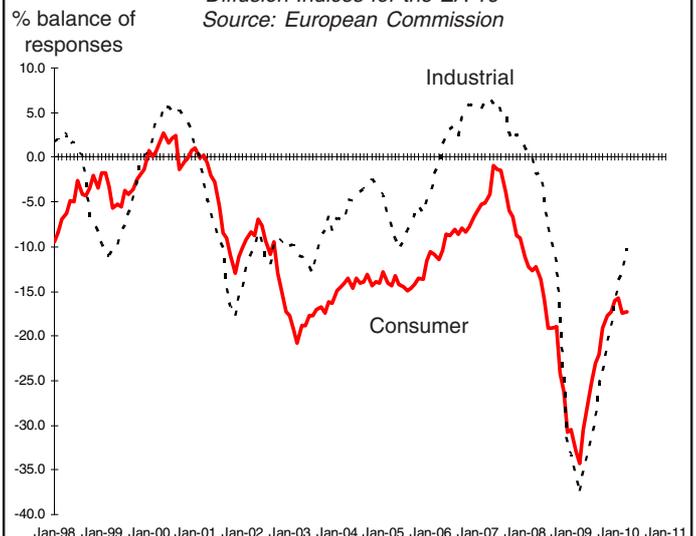

**Euro Zone Economic Statistics**

The source of all Historical Data (facing page) is Eurostat, with the exception of the Current Account and the Money Supply, M3, which are from the **European Central Bank**. The base years and statistics methodologies used by Eurostat may differ from those used by individual Euro zone-member countries included in *Consensus Forecasts*. Eurostat data is often drawn from the national statistical agencies within the Euro zone but is adjusted to achieve standard classifications.

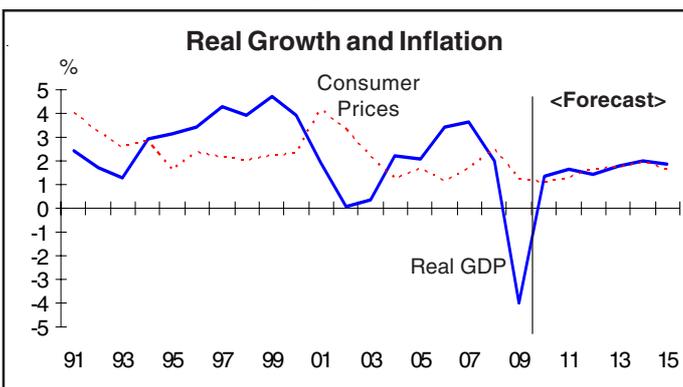

**Consumer and Industrial Confidence**

- Forecasts have edged up this month for the Netherlands as the recovery begins to take hold. Of particular note is the improvement in the current account outlook, as the Netherlands is heavily reliant on export-led growth in the absence of strengthening consumer demand (predicted to be mildly negative again in 2010).
- The public finances have been hit hard by the recession, as the Central Planning Bureau predicts that the total debt-to-GDP ratio will rise from 45.5% in 2007 to 68.9% by 2011, while the budget deficit will not fall below the 3% of GDP level until 2015.

◆ The Norges Bank left interest rates on hold in March after anticipating that inflation and economic activity will be lower than expected. Retail sales and industrial production initially fell on a monthly basis in January before recovering slightly in February, though the purchasing managers' index for manufacturing in March remained relatively weak at 49.6. Production forecasts have dipped.

◆ GDP forecasts have edged down slightly this month and those for the current account have fallen even more noticeably as the krone continues to appreciate against the euro.

◆ In a bid to avoid the same outcome as Greece, prime minister Zapatero is taking radical steps to shake up the nation's finances and restore confidence amongst investors. Though progress has been made by securing the cooperation of the regional governments in making cuts, social security spending shows no signs of easing as unemployment rose further, by around 59,000 from February to March.

◆ The PMIs for manufacturing and services finally rose above 50 in March, indicating expansion in the sectors, though the levels are still below the Euro zone average.

While confidence surveys suggest that a recovery is forthcoming, with the purchasing managers' index stabilising around 61 and various consumer confidence indices rising, other data is less supportive. February was a bad month as the trade surplus fell sharply after imports grew at a much faster pace than exports. Furthermore, retail sales were down 1% (m-o-m) and industrial production contracted by 0.8% (m-o-m).

The situation is expected to improve as the year goes on, however, as consensus forecasts for GDP growth edge up this month to 2.2% and 2.8% for this year and next.

◆ The recovery in Switzerland appears to be picking up pace, as the government agency SECO upgraded its forecast for 2010 GDP from 0.7% to 1.4%. Consensus forecasts have also improved, reaching 1.8% this month. Expectations were driven by surges in exports and manufacturing as the global recovery takes hold. The PMI for manufacturing even jumped from 57.4 in February to 65.5 in March, indicating a significant expansion.

◆ One factor which may hold back the recovery is a further rise in the Swiss franc against the euro, which could damage exports.

Oil Prices Step into Higher Gear

West Texas Intermediate (WTI) hit US\$86 per barrel on the week of April 5 and remained strong on the back of the Euro zone agreeing to a €30bn loan to help struggling Greece. The price of crude has risen by 75% over the past year and from US\$71.7 in February, spurred by the global economic recovery. OPEC's current production quotas now look increasingly geared towards a lower price level, though observers speculate that the oil cartel will hold off from expanding output for the time being. The possibility that futures might even surge to US\$100 per barrel could derail the nascent rebound in activity. Indeed, the International Energy Agency has once again raised its 2010 forecast for oil demand, to 86.6mn barrels per day. Our panel has also raised the likelihood of a higher US\$80-100 trading range (see left).

Latin America <sup>5</sup>	-2.3	4.0	3.7	5.5	7.5	6.8	-20.6	-46.9	-73.0
Other Countries <sup>6</sup>	1.2	4.0	4.7	7.2	6.6	6.5	23.0	60.3	68.5
<b>Total</b>	-2.1	3.2	3.3	1.4	2.7	2.7			

Regional totals, as well as the grand total for GDP growth and inflation, are weighted averages calculated using **2008 GDP weights, converted at average 2008 exchange rates**. Current account forecasts given in national currencies on pages 7-24 have been converted using consensus exchange rate forecasts for the purposes of comparison. <sup>1</sup>USA and Canada. <sup>2</sup>The Euro zone aggregate is taken from our panel's latest forecasts (pages 18-19). The Euro zone current account data and forecasts are based on *extra-euro zone data*, i.e., they are compiled from an aggregate of the Euro zone member states' transactions only with nonresidents of the Euro zone. The European Union data includes the Euro zone countries listed on page 18 plus Denmark, Sweden and the United Kingdom, as well as May 2004 entrants the Czech Republic, Estonia, Hungary, Latvia, Lithuania and Poland, plus Romania and Bulgaria who entered in January 2007 (data taken from Eastern Europe Consensus Forecasts). Western Europe comprises the Euro zone plus Denmark, Sweden and the United Kingdom, along with Norway and Switzerland. <sup>3</sup>Survey results for Japan plus fifteen other countries taken from **Asia Pacific Consensus Forecasts**. <sup>4</sup>Twenty-seven countries, including eleven European Union countries taken from the latest issue of **Eastern Europe Consensus Forecasts**. <sup>5</sup>Eighteen countries taken from the latest issue of **Latin American Consensus Forecasts** (Inflation figures are on a December/December basis). <sup>6</sup>Egypt, Israel, Nigeria, Saudi Arabia and South Africa.
