

**Atlantic Wallboard Limited**  
**Interrogatory No. 1**

**Reference:** Exhibit “A”, Page 4 of 17, Q. & A. 7

**Interrogatory**

- a) Mr. Charleson states “EGNB believes that the testimony put before the Board in those proceedings is still relevant”. Specifically what evidence/testimony is EGNB relying upon? Please provide exhibit and/or transcript references.

**Response**

- a) EGNB believes it is important to clarify that it is referencing, not “relying upon” the evidence in the 2008 rate proceedings. In EGNB’s 2008 application for changes to the Contract Large General Service LFO (“LFO”) rate (NBEUB 2007-016), EGNB identified in its evidence the use of a 21-day average to determine retail oil and natural gas commodity prices (pages 7-8) and provided the supporting rationale in its response to AWL Interrogatory No. 12. In the same proceeding, AWL filed a report prepared by John Reed that provided his opinion regarding the use of a 21-day average and proposed alternatives (pages 4–6) and provided additional information in response to EGNB Interrogatory No. 10. In addition, questions were put to witnesses during cross examination and argument was made on the appropriate time period to be used (transcript pages 162-166, 350-352, 441, 456-459, 555-558 and 590-594).

EGNB also submitted evidence in its 2008 application for changes to the rates for other general service rate classes (NBEUB 2007-018) using a 21-day average (page 9) and provided additional information in response to Board Interrogatory No. 13. Additional questions were put to EGNB during cross examination and argument was made on this element of EGNB’s evidence (transcript pages 172-176, 207-212, 348-349).

Based on the evidence, the Board concluded in the LFO decision and the decision regarding the other rates that 21 days was too short of a sample period. In both cases, the Board ruled that a 60 day, or 42 days of market data (a period of approximately two months), would be used for those applications. While EGNB still believes that 21 days is the most appropriate sample period for establishing its rates, it was guided by the Board’s findings in the 2008 proceedings in developing its proposal for the formula in this proceeding.

**Atlantic Wallboard Limited**  
**Interrogatory No. 2**

**Reference:** Exhibit “A”, Page 6 of 17 Q. & A. 12

**Interrogatory**

- a) Explain how EGNB believes that continued use of an “efficiency factor” is relevant to pricing involving newly constructed customers as opposed to conversion customers?

**Response**

- a) It is important to note that an efficiency factor is not used for LFO customers like AWL. For the classes where an efficiency factor is used, it will differ in relevance to each customer converting to natural gas. The gain in efficiency for newly constructed customers will likely be less than that seen by customers converting older equipment to natural gas. In the case of new construction, the alternate fuel equipment choices are likely to have improved efficiencies in comparison to older equipment in existing premises. However, the purpose of the formula is to develop postage stamp rates that provide typical customers with the opportunity to achieve target levels of savings. For each customer, whether new construction or conversion, their circumstances will differ and rates cannot be set to address each unique situation. Given the size of the existing customer base, EGNB believes that it is appropriate to factor in the efficiency gains that many existing customers will have seen, and prospective customers will see, from the conversion to gas.

**Atlantic Wallboard Limited**  
**Interrogatory No. 3**

**Reference:** Exhibit “A”, Page 11 of 17, Q. & A. 20

**Interrogatory**

- a) What evidence presented in prior rate cases is EGNB relying upon in support of its position on the “target savings level”? Please provide exhibit and/or transcript references.

**Response**

- a) The target savings levels were originally proposed and approved in EGNB’s original rate setting proceeding, NBPUB 299. EGNB’s evidence can be found at Exhibit A, pages 7-8, Exhibit O, pages 2-3, EGNB’s response to Province of New Brunswick Interrogatory No. 2(b), Irving Interrogatory No. 1, April 10, 2000 transcript pages 153-154 and the July 18, 2000 transcript pages 1222-1227. Since that time, evidence on target savings can be found in EGNB’s 2004 rates application (NBPUB 2004/001) at Exhibit A, page 5 and the response to Maritime Natural Gas Contractors Association Interrogatory No. 6. In the 2005 rates application (NBPUB 2004-053) the evidence can be found at Exhibit A, pages 5-6 and in the responses to Board Interrogatory No. 8, Competitive Energy Services Interrogatory No. 6 and Flakeboard Interrogatory No. 17. In each of these cases, the Board approved the target savings levels as proposed by EGNB.

Additional evidence was presented in EGNB’s 2008 application to change its rates for a number of rate classes (NBEUB 2007-0018). The evidence in this proceeding can be found at Exhibit A, page 7 and the responses to Board Interrogatories No. 3, No. 6 and No. 10. In this proceeding the Board found that it would not approve the proposed change to the target savings for Contract General Service customers “based on the fact that not enough evidence was provided to convince the Board that such a change is appropriate at this time.”(April 9, 2008 Decision, page 5)

**Atlantic Wallboard Limited**  
**Interrogatory No. 4**

**Reference:** Exhibit “A”, Page 13 of 17 Q. & A. 27

**Interrogatory**

- a) Please provide a copy of the determination of the “market spread” (provided under the auspices of the Board’s confidentiality policy is acceptable).

**Response**

- a) The \$2.25 has been determined by including costs intended to cover the following:
- i) the cost associated with the purchase price of a long term supply contract held by EGNB;
  - ii) administrative costs; and
  - iii) margin to cover any risk associated with Basis and Foreign Exchange volatility throughout the term of the price offering.

Given the commercial nature of the long term supply contract, EGNB is unable to provide further details regarding the calculations. EGNB does not believe this can be filed in confidence as other intervenors in this proceeding are participants in the commercial gas supply markets and access to the contract information may prejudice the supplier’s position in the market.

**Atlantic Wallboard Limited**  
**Interrogatory No. 5**

**Reference:** Exhibit “A”, Pages 14 & 15 of 17 Q. & A. 28

**Interrogatory**

a) Please provide the basis upon which EGNB believes EVP provides “price transparency”?

**Response**

a) The pricing of the EVP product is generally available to the marketplace and is placed on EGNB’s web site. The basis for the pricing has been made public through recent regulatory proceedings. The same pricing is made available to all commercial customers requesting commodity under this service. This provides full transparency to the price available in the market.

**Atlantic Wallboard Limited**  
**Interrogatory No. 6**

**Reference:** Exhibit “A”, Page 17 of 17, Q. & A. 33

**Interrogatory**

- a) Please provide the rationale for using 21 trading days in a Rate Rider application.

**Response**

- a) EGNB is proposing that 21 trading days be used in a Rate Rider application to allow EGNB to be responsive to changes in the competitive position of natural gas against competing fuels. The methodology used for Rate Riders needs to recognize the timing of rider applications, address factors impacting commodity markets and be reasonably reflective of the manner in which the competing fuel prices are set for EGNB to maintain the ability for a typical customer to achieve target savings.

EGNB typically has the ability to adjust its rates on a monthly basis through the use of a Rate Rider application. The current process for implementing a Rate Rider requires EGNB to provide the Board with at least 14 days to review and approve any rider request. After allowing the time to determine the applicability of a rider and prepare the application, this will generally result in a monthly cycle for applying rate riders. By using a 21 day average, the time period used for evaluating commodity pricing matches this cycle, enabling EGNB to be responsive to changes that are occurring in the marketplace.

The use of a 21 day average also balances the need to be responsive to changing market conditions, by considering major market price events that have longer term price implications, while ignoring minor events that will not impact longer term prices. A major market event, such as a terrorist act which impacts supply, or sustained cold or economic downturn which impacts demand will have an impact on intermediate to long term pricing. A minor market price event, such as the threat of a tropical storm or hurricane which has little to no impact on supply, will impact pricing in the short term, up to 7 days. It is important that the duration used for Rate Riders allows EGNB to be responsive, but also considers major market price events, while ignoring minor events. The 21 day average balances these elements.

Since the purpose of EGNB’s market based rates is to provide a target savings in comparison to fuel alternatives, the methodology used for establishing the price needs to be reasonably reflective of the manner in which the competing fuel prices are set. Retail oil prices change frequently in response to market conditions and EGNB’s rates need to be able to respond to these changes. The price of oil will change regularly and EGNB needs to be able to respond to maintain its competitiveness. EGNB believes the use of a 21 day average for Rate Riders provides the best ability to respond.

**Atlantic Wallboard Limited**  
**Interrogatory No. 7**

**Reference:** Exhibit “A”, Schedule 3 – MJ Ervin & Associates Report – Page 10

**Interrogatory**

- a) Provide copies of the data upon which Mr. Ervin relied to arrive at his conclusion that LFO customers “...generally receive a discount of about 5 cents per litre off the residential price”.

**Response**

- a) As stated in our report on Page 8:

“... our model is based on “typical” discounts, as we have determined in interviews with fuel marketers. No marketer was willing (nor did we expect) to formally provide a discount schedule based on volume, since none exists. As there are no “posted” prices for other than residential (i.e. no formal rate “classes” as per EGNB), discounts can vary from one customer to another, and will vary over time according to competitive pressures. ”

**Atlantic Wallboard Limited**  
**Interrogatory No. 8**

**Reference:** Exhibit “A”, Schedule 3 – MJ Ervin & Associates Report – Page 11

**Interrogatory**

- a) Please provide the data upon which Mr. Ervin’s Figure 8 is created including the basis for the “wholesale margin” and “retail margin delivery” amounts as well as the data upon which Mr. Ervin relied to determine these amounts and the “furnace oil rack price”.

**Response**

- a) Figure 8 is simply a graphical representation of MJ Ervin & Associates’ recommended spreads over the New York Harbour No. 2 Oil price. The calculation for the recommended spreads in each rate class is presented on pages 9 and 10 of the MJ Ervin & Associates Report.

The retail margin reflects the maximum regulated furnace oil margin (23 cents per litre) minus 0.5 cents per litre (to reflect the fact that historically marketers have chosen to charge less than the regulated maximum). The wholesale margin presented in Figure 8 represents the difference between the wholesale rack price and the New York Harbour No. 2 oil spot price. The wholesale margin was not quantified in Figure 8 as the graphic does not refer to a specific timeframe – these margin depictions are shown in Figure 8 simply to illustrate the definitions of these terms. Rack prices are not used in proposed formulae; these are based on New York Harbour spot prices (except in the case of HFO).

**Energy and Utilities Board**  
**Interrogatory No. 1**

**Reference:** Exhibit A, Evidence of EGNB

**Interrogatory**

Please list all areas in the formula where changes in the source information or calculation methodology are proposed.

**Response**

The formula has been changed in the following manner:

- the calculation methodology for all line items has been changed to specify the number of digits that numbers are rounded to;
- the source information and calculation methodology of the Alternative Energy Price (Line 1) has been changed based on the recommendations of MJ Ervin & Associates;
- the source information for the Typical Annual Consumption (Lines 3 and 5) has been changed to use natural gas consumption data from the most recent 12 month period;
- the source information for the Typical Annual Natural Gas Consumption (Line 10) has been changed to use natural gas consumption data from the most recent 12 month period;
- the calculation of the Commodity Cost (Line 12) has been changed to use two calendar months (42 days) of historic information instead of one month (21 days); and
- the source information for Average Contract Demand (Line 17) has been changed to use contract demand data from the most recent 12 month period.

**Energy and Utilities Board**  
**Interrogatory No. 2**

**Reference:** Exhibit A, Evidence of EGNB, Page 2, A-3

**Interrogatory**

Please confirm that calculations in the formula where numbers are rounded to 4 decimal places is a change from the previous method used by EGNB.

**Response**

The rounding of calculations to 4 decimal places is a change from the previous method used by EGNB.

**Energy and Utilities Board**  
**Interrogatory No. 3**

**Reference:** Exhibit A, Evidence of EGNB, Page 2, A-3

**Interrogatory**

Has EGNB developed a formula that could be used for the LFO second and third blocks? If so, please provide it as well as an explanation of how it could work. Please also explain why EGNB does not feel that a formula should be used for those blocks.

**Response**

EGNB has not developed a formula that could be used for the LFO second and third blocks as the vast majority of LFO customers only consume within the first block and the target savings for this class of customers has historically been determined based on the first block rate.

EGNB does not believe it is appropriate to use a formula for these blocks as there are limited customers consuming gas in these blocks and there is no transparency to the factors that may be impacting their target savings levels. The second and third blocks were originally implemented to recognize the buying power of much larger natural gas users. EGNB believes that users with consumption in these blocks still maintain comparable buying power and the absence of any visibility to the results of this buying power make it difficult to develop any formula to manage target savings levels for consumption within the second and third blocks.

EGNB believes the fact that its largest LFO customers continue to consume gas within these blocks means that target savings, at minimum, are being achieved. However, these customers have also expressed concerns regarding EGNB rates for large users, suggesting that increases to these blocks may impact their consumption levels. As a result, EGNB is not proposing a formula or change to the rates for these blocks at this time.

**Energy and Utilities Board**

The consumption for all customers meeting the criteria specified in A22 of EGNB's evidence has been used in determining the profiles.

**Energy and Utilities Board**  
**Interrogatory No. 5**

**Reference:** Exhibit A, Evidence of EGNB, Pages 6-7, A-12

**Interrogatory**

- (a) Please provide the data and its source, used to support the comment that “The typical efficiency of oil equipment within the New Brunswick market used in all rate classes, excluding LFO and HFO, is typically lower than the efficiency of the natural gas equipment being installed.”
- (b) For all natural gas heating and domestic hot water equipment installed by EGNB in the last 3 years, please provide the models installed, the number of each model installed and the manufacturer’s recommended efficiency for each model.
- (c) Is a cost for water heater rental included for the classes other than SGSRE? If not, why not?

**Response**

- (a) The efficiency assumptions made by EGNB are based on industry knowledge, one of which is based on the differentiation of the physical properties of the two fuels. For example, most of the natural gas used by EGNB customers is for space heating. When natural gas and heating oil are combusted in a space heating appliance, the efficiency of the appliance is expressed by the percentage of useful energy that is used to heat the space, while the remaining energy in the fuel is wasted through venting of the flue gases outdoors.

The flue gas contains a variety of gases including water vapour and unburnt fuel. In the case of water vapour, it includes both specific heat and latent heat from the combustion of the fuel. The latent heat in the water vapour of the flue gases from natural gas constitutes about 10% of the energy available in the fuel. A high efficiency natural gas furnace is designed to capture a portion of this heat by adding a secondary heat exchanger, which cools the flue gas below the dew point, thereby condensing the water vapour and transferring the specific and latent heat into the space being heated. Because natural gas is clean burning, it is relatively inexpensive to manufacture appliances that can capture the latent heat of combustion.

The flue gas from heating oil includes unburnt fuel and sulphur in addition to water vapour. This makes it very difficult and expensive to manufacture appliances to capture the latent heat of combustion because the flue gas is very corrosive and dirty. Almost 100% of the natural gas furnaces sold in New Brunswick are high efficiency condensing

models, whereas, EGNB is not aware of any condensing oil furnaces being sold in Canada<sup>1</sup>.

EGNB also notes that an efficiency factor refers to the effective efficiency of the system using the energy. This is the amount of energy required to accomplish the end result divided by the actual amount of energy consumed. For example, in the case of space heating the end result is the occupants' comfort. Any measures that are taken to reduce the amount of energy consumed while maintaining the occupants' comfort will increase the effective efficiency. Using a set back thermostat to reduce the set point during times when the building is not occupied will reduce energy without affecting comfort. The effective efficiency of energy consuming systems can vary greatly while still providing the desired end result.

The following are some of the other factors that can affect efficiencies and an explanation of how the efficiency of existing oil-fired appliances compare to new natural gas appliances.

#### Residential and Small Commercial (SGSRO, SGSC)

The Annual Fuel Utilization Efficiency (AFUE) of a heating appliance accounts for the seasonal efficiency of the appliance over the entire heating season and accounts for jacket losses, flue loss in the burner off cycle and pre and post purging as well as combustion efficiency. This is the only measurement that will allow an accurate comparison of the efficiency of one appliance to another. The AFUE of a heating appliance can only be determined using a test method specified in the standard for that appliance. The results of the test are certified by a testing agency such as Canadian Standards Association (CSA). This is now part of the certification process that manufacturers of residential furnaces and boilers must do to label their appliances as being CSA approved. Therefore, the seasonal efficiencies of modern oil and gas-fired furnaces and boilers can be easily determined and compared to each other.

Many of the customers that EGNB are targeting will have oil-fired appliances that were manufactured prior to the AFUE test procedure. Therefore, establishing seasonal efficiencies for old furnaces and boilers can only be based on the judgment of an expert in this field. The only efficiency test that can be done on these appliances is a steady-state combustion test. Steady-state efficiency measures the maximum efficiency the furnace achieves after it has been running long enough to reach its peak-level operating temperature.

This is an important standardized testing procedure that is used by a serviceperson to adjust the oil burner, but the figure it gives is not the efficiency the furnace or boiler will achieve in actual use over the course of a heating season. The difference between the

---

<sup>1</sup> The Department of Energy's Energy Star web site in the U.S. lists three manufacturers of condensing oil furnaces but Natural Resource Canada's Energy Star web site lists none.

steady state efficiency for an old furnace and the seasonal efficiency is about 10% or more. Therefore, a furnace with a steady-state efficiency of 75% would have a seasonal efficiency of about 65%. Also, the combustion of oil leaves a carbon soot deposit on the heat exchange surfaces of the appliance and must be cleaned annually to maintain its efficiency. The steady-state efficiency of an oil appliance deteriorates from the time it is cleaned until the following year when it is cleaned again, whereas natural gas appliances burn clean so there is no loss of efficiency over time.

EGNB obtained statistics from Natural Resources Canada's EnerGuide for Houses program on the estimated steady state efficiency of furnaces and boilers found in the homes in New Brunswick that have been audited under this program between August 2002 and September 2005. The average steady-state efficiency for the 525 homes audited was 74%, which means the average seasonal efficiency would be in the 65% or less range. Although this is a relatively small sample, and homeowners that are interested in participating in the EnerGuide for Homes program likely have higher than average energy bills, the results demonstrate that homes in the older parts of the cities, where EGNB has built distribution mains, do have old inefficient furnaces and boilers. There are no doubt homes with new oil furnaces and boilers that do have seasonal efficiencies of up to 85%. However, EGNB does not expect a homeowner with a new oil furnace or boiler to replace it strictly on the basis of economics.

All of the residential natural gas furnaces and close to 100% of the boilers being installed in New Brunswick are high-efficiency condensing models (as discussed above). High-efficiency furnaces have AFUE ratings from 92% to 94%. High-efficiency natural gas boilers would be slightly less than this.

While the average efficiency of existing oil equipment in the residential and small commercial market is likely improving, it will be doing so at a relatively slow rate as equipment reaches the end of its economic life (20-30 years). When this modest improvement to the average oil equipment of prospective customers is combined with the average efficiency improvement that existing customers have received, EGNB believes that retaining seasonal efficiencies of 68% for oil and 87% for natural gas in the SGSRO and SGSC rate classes is reasonable.

#### Commercial (GS, CGS)

While there will be a certain degree of consistency in the efficiencies seen in the residential oil and small commercial classes, the effective efficiency can vary widely within the GS and CGS classes. The following are some of the factors that can affect this efficiency and an explanation of how the efficiency of existing oil-fired appliances compare to new natural gas appliances:

## 1. Combustion Efficiency

Combustion efficiency is the appliance's ability to convert the gross heat input into useful heat output. Combustion efficiency losses include the uncombusted fuel and the latent and sensible heat loss in the flue gas. This method of measurement ignores all other heat losses from the appliance and only demonstrates the combustion efficiency at one point in time in a steady state condition.

The combustion efficiency of oil fired appliances in the commercial market can vary significantly. Some new oil fired appliances can have combustion efficiency ratings equal to or even higher than the same appliance using natural gas. This is primarily due to lower levels of hydrogen in oil compared to natural gas. The more hydrogen there is in a fuel, the more latent heat there is in the flue gas. As described earlier, latent heat can be recovered from the flue gas by condensing the water vapour produced during the combustion process. However, a commercial oil-fired appliance is unable to condense its products of combustion due to high levels of sulphur in the fuel, which makes the products of combustion very corrosive. So when natural gas is fired in the same appliance, there is no ability to capture the latent heat produced and in fact these appliances must be designed with lower efficiencies to ensure that no condensing takes place.

However, natural gas appliances that are designed for gas can capture the latent heat of combustion and exceed new oil appliances by about 10%. Heating systems that have low return temperatures will have higher efficiencies than those with high return temperatures. Therefore, air heating appliances, and those with low return water temperatures can have combustion efficiencies over 95%. In the case of appliances with old oil burners, the combustion efficiency can be below 70%.

## 2. Thermal Efficiency

Thermal efficiency measures the effectiveness of the heat exchanger to transfer heat from the combustion process to the heating medium excluding radiation and convection losses, on a steady state basis. This is a more accurate measure of efficiency than simply measuring the combustion efficiency but since the measurement is done on a steady state basis, it does not account for losses that occur through normal on-off cycling. One disadvantage of oil-fired appliances is that the heat transfer surfaces must be kept free of soot that is formed when oil is combusted, whereas natural gas burns clean and never fouls the heat transfer surfaces.

## 3. Seasonal Efficiency

As discussed above, seasonal efficiency is the efficiency of the appliance over the entire heating season and is usually referred to as AFUE, which can only be determined using a test method specified in the standard for that appliance to receive CSA certification.

CSA is only applicable to heating appliances with inputs of 300,000 BTU/hour or less, therefore, the seasonal efficiencies of modern oil and gas-fired furnaces and boilers with inputs under this threshold can be easily determined and compared to each other. In New Brunswick, most natural gas furnaces and boilers will have higher AFUE ratings than new oil furnaces and boilers because EGNB promotes and sells appliances that have higher AFUE ratings than oil appliances sold here.

Although the AFUE ratings (or seasonal efficiency) for appliances over 300,000 BTU/hour are not certified, many of the design features of appliances with high AFUE ratings are also included in natural gas furnaces and boilers with firing rates above 300,000 BTU/hour. For example, boilers that are designed to only fire natural gas can have such features as secondary condensing heat exchangers to capture the latent heat of combustion and horizontal side wall venting and direct venting to reduce flue losses during the burner off cycle. These are the features that are found on smaller gas-fired boilers that contribute to high AFUE ratings over 90%. Therefore, when comparing a new oil appliance at 85% combustion efficiency and a natural gas appliance at 85% efficiency, consideration must also be given to features that do not affect combustion efficiency but do affect seasonal efficiency.

#### 4. Other Efficiency Considerations

Boilers are often located away from the space being heated in a room that has large fresh air openings that bring in ambient air for combustion. The radiant heat loss from the boiler is lost, which results in lower seasonal efficiencies. Most old oil-fired boilers are significantly oversized, which exacerbates the amount of fuel wasted through standby losses. As noted above, modern natural gas boilers are available with sealed combustion, which eliminates the standby loss associated with combustion air.

The distribution system that delivers the steam or hot water to the area being heated can also increase losses. For example, a warehouse using steam or hot water unit heaters located at the ceiling will waste far more energy than a natural gas-fired radiant tube heater, which is commonly used to heat spaces with high ceilings. A unit heater at the ceiling will cause large vertical temperature gradients between the ceiling and the floor level where the heat is required. High temperatures at the ceiling cause increased heat loss through the roof. A natural gas radiant tube heater directs the heat at the floor allowing lower room temperatures while increasing occupant comfort.

Similarly, oil-fired unit heaters have seasonal efficiencies well below natural gas radiant tube heaters. Tests done by the Gas Research Institute<sup>2</sup> found that unit heaters consumed twice as much energy as radiant tube heaters even when the combustion efficiency of the unit heaters is greater than the radiant tube heater. If oil-fired unit heaters are just

---

<sup>2</sup> Tubular Radiant Heater versus Unit Heater: Comparative Testing, Gas Research Institute, GRI-02/0240 August 2002

replaced with natural gas-fired unit heaters there will still be a significant increase in seasonal efficiency. Modern natural gas unit heaters are available with sealed combustion, which reduces the standby loss considerably and others are available with secondary condensing heat exchangers that have seasonal efficiencies of 90% or better.

Other efficiency measures that often get implemented when new appliances are installed include controls that more closely match the output of the appliance to the needs of the building. These controls are effective on both oil and gas systems but the most cost-effective time to install the proper controls is when the appliance is being installed so customers switching to gas will see incremental benefits from these measures as well.

Given the variety of efficiency improvements available with commercial natural gas-fired heating appliances, some customers switching from oil will see efficiency improvements of less than 15 percent and others will see more. However, on average, and for all of the reasons indicated, EGNB believes retaining the efficiency factors of 65% for oil and 80% for natural gas in the GS and CGS rates classes is appropriate to provide the opportunity for typical customers to achieve target savings.

- (b) Please see the attached table that provides the required information. While EGNB has endeavoured to provide the manufacturer's recommended efficiency for each model, EGNB was unable to find this information for certain equipment.
- (c) The cost for a water heater rental is not included for the classes other than SGSRE due to a lower degree of certainty that a water heater rental will have been used by the customer prior to conversion as alternate appliances (e.g. oil or propane fired water heater, oil boiler, etc.) may have been used to satisfy this need and/or for commercial customers domestic hot water may not be part of the conversion to natural gas. Including a rental charge for customers in these other classes would increase the delivery rate and not necessarily reflect the typical customer cost, which would compromise the ability to achieve target savings levels.

**Energy and Utilities Board**  
**Interrogatory No. 6**

**Reference:** Exhibit A, Evidence of EGNB, Page 7, A-13

**Interrogatory**

Please provide the source documents for all conversion factors from gigajoules to litres.

**Response**

The image from the Natural Resources Canada website on the next page shows the conversion factors used for Light Fuel Oil (#2) and Heavy Fuel Oil (#6). A m<sup>3</sup> of liquid is equivalent to 1,000 litres. Since the conversion factors reflect GJ/m<sup>3</sup> the conversion for litres/GJ is determined by:

- Light Fuel Oil –  $1/38.68 * 1,000 = 25.8532$
- Heavy Fuel Oil –  $1/41.73 * 1,000 = 23.9636$

**Energy and Utilities Board**  
**Interrogatory No. 7**

**Reference:** Exhibit A, Evidence of EGNB, Page 8, A-16

**Interrogatory**

- (a) Please provide the information, data or study to support the annual electricity consumption and the monthly usage profile.
- (b) Please explain why the usage profile in A-16 does not match the profile (as it relates to Heating Use) in Schedule 2, Page 4.

**Response**

- (a) The annual electricity consumption and the monthly usage profile was established on the following basis:
  - i) The average annual consumption for existing SGSRE customers using natural gas for space and domestic hot water was determined to be 111 GJ based on 2008 consumption.
  - ii) The average monthly consumption for domestic hot water is based on a study that was done by the Load Research group within Enbridge Gas Distribution in an Ottawa home, where the natural gas use was measured over a 365 day period. A copy of these results is attached, which shows 26 GJ of gas being used for domestic hot water.
  - iii) The space heating requirement of 85 GJs was determined by subtracting the water heating load from the total annual consumption of 111 GJ.
  - iv) The remaining 85 GJ were then allocated to the individual months in amounts necessary to arrive at the typical usage for that month as seen during 2008 for SGSRE customers.
  - v) The natural gas use for domestic hot water and space heating was then converted to kWh by adjusting for the difference in the efficiencies between natural gas and electric water heaters and furnaces and then converting from GJs of natural gas to kilowatt hours of electricity. This conversion assumes an electric water heater efficiency of 90%, electric space heat efficiency of 100%, gas water heater efficiency of 60% and gas space heat efficiency of 92%. It also applies a standard conversion factor of 1 GJ = 277.84 kWh. This results in the following calculation for heating and water heating consumption:

		<b>Calculation</b>	<b>Result</b>
1.	Typical gas consumption	2008 Actual	111 GJ
2.	Water heating load	Estimate	26 GJ
3.	Heating load	Line 1 – Line 2	85 GJ
4.	Electric heat load (GJ)	Line 3 * 92%/100%	78.2 GJ
5.	Electric heat load (kWh)	Line 4 * 277.84	21,727 kWh
6.	Electric water heating (GJ)	Line 2 * 60%/90%	17.3333 GJ
7.	Electric water heating (kWh)	Line 6 *277.84	4,816 kWh

- (b) The usage profiles provided in A-16 of the evidence do not match the profiles in Schedule 2, Page 4 due to an oversight on the part of EGNB. The usage profiles found in A-16 are the historic profiles used when the Typical Annual Natural Gas Consumption was 114 GJs per year. When EGNB revised the Typical Annual Natural Gas Consumption to 111 GJs per year to reflect 2008 SGSRE consumption, the usage profiles were updated to reflect the change in consumption and the usage profiles experience in 2008. The updated profiles were inadvertently not transferred to A-16, but were correctly applied to the derivation found in Schedule 2, Page 4.

**Energy and Utilities Board**  
**Interrogatory No. 8**

**Reference:** Exhibit A, Evidence of EGNB, Page 11, A-20

**Interrogatory**

- (a) Please provide the existing studies or any empirical evidence that the target savings rates are adequate.
- (b) Does EGNB have any estimate of price elasticity for Natural Gas customers in New Brunswick? If yes, please provide estimates and supporting documentation

**Response**

- (a) EGNB has not conducted any studies regarding the adequacy of target savings rates. The empirical evidence that EGNB relies on is the rate of conversion that continues to occur with the target savings levels in place. If target savings are higher than necessary to incent customers to convert to and continue using natural gas, the deferral account will grow unnecessarily. If target savings levels are too low, EGNB will experience greater challenges in attracting new customers, which also has negative consequences on the business. By continuously monitoring its sales activities, and considering feedback from potential customers during the sales process, EGNB is confident that the target level of savings proposed continues to provide the necessary balance between attracting and retaining customers and minimizing additions to its deferral account.
- (b) EGNB does not have an estimate of price elasticity for natural gas customers in New Brunswick.

**Energy and Utilities Board**  
**Interrogatory No. 9**

**Reference:** Exhibit A, Evidence of EGNB, Page 11, A-22

**Interrogatory**

- (a) Please provide the supporting data for the Typical Annual Natural Gas Consumption.
- (b) Please identify any changes in the typical annual consumption by class and describe the reasons for any change.

**Response**

- (a) Please see the response to Board Interrogatory No. 4 (a) for the supporting data for the SGSRE, SGSRO, SGSC, GS, and CGS rate classes. The following tables contain the supporting data for the LFO and HFO classes:

	<b>2008 Consumption (GJs)</b>
LFO 1	16,234
LFO 2	16,992
LFO 3	18,292
LFO 4	19,279
LFO 5	19,540
LFO 6	19,905
LFO 7	21,069
LFO 8	23,659
LFO 9	27,705
LFO 10	31,302
LFO 11	38,443
LFO 12	41,982
LFO 13	50,090
LFO 14	64,913
LFO 15	92,709
<b>Average</b>	<b>33,474</b>

<b>2008 Consumption (GJs)</b>	
HFO 1	46,483
HFO 2	52,192
HFO 3	89,690
HFO 4	107,245
HFO 5	137,480
HFO 6	157,644
HFO 7	335,557
<b>Average</b>	<b>132,327</b>

(b) The following changes in typical annual natural gas consumption are being proposed in the formula:

	<b>Annual Consumption</b>		
	<b>Prior</b>	<b>Proposed</b>	<b>Change</b>
SGSRE	114	111	(3)
SGSRO	114	84	(30)
SGSC	195	223	28
GS	1,175	913	(262)
CGS	4,400	4,946	546
LFO	31,745	33,474	1,729
HFO	33,227	132,327	99,100

These changes are due to changes that have occurred in the typical consumption profile over time as more customers have been added to the system. In the case of SGSRO customers, the reduction is largely due to the number of Private Married Quarters (“PMQs”) at Base Gagetown in Oromocto that were converted in 2007 that represent a high percentage of SGSRO customers (approximately 35%) and are smaller homes with lower consumption. For GS, CGS and LFO customers, the changes are attributable to the mix of customers and consumption patterns. The significant increase in HFO reflects the fact that this annual consumption number has not been revisited since the market formula was first put in place and consumption in this rate class has been greater than originally expected.

**Energy and Utilities Board**  
**Interrogatory No. 10**

**Reference:** Exhibit A, Schedule 2, Page 1, Page 4

**Interrogatory**

- (a) Please explain why the Typical Annual Natural Gas Consumption is not the same for both SGSRE and SGSRO customers.
- (b) Please provide the supporting data for the difference.

**Response**

- (a) The Typical Annual Natural Gas Consumption is not the same for both SGSRE and SGSRO customers as the 2008 consumption and usage profiles for the customers in these classes differ.
- (b) Please see the response to Board Interrogatory No. 4 (a).

**Energy and Utilities Board**  
**Interrogatory No. 11**

**Reference:** Exhibit A, Schedule 2 Page 1, Derivation Table SGSRO Line 1-6 SGSRO

**Interrogatory**

Please explain why Line 6 for the SGSRO class is not 2148.56 (.7767 x 2766.27 = 2148.56.)

**Response**

Upon investigation, EGNB has determined that in applying the usage profiles to create the weighted average oil prices the resulting monthly numbers were not rounded to 4 decimals. The same was found to be the case for the litres to GJ conversion factor. The following tables reflect the correct weighted average calculation and litres to GJ conversion factor and resulting Derivation Table – Oil:

\* Table shows potential rates for calendar 2009 based on the application of the Formula using market information from November and December 2008. Natural gas consumption and contract demand amounts are based on 2008 billing data.

**Energy and Utilities Board**  
**Interrogatory No. 12**

**Reference:** Exhibit A Schedule 2, Page 2, Usage Profile and Weighted Average

**Interrogatory**

Please provide detailed calculations for Usage Profile & Weighted Average for each class.

**Response**

Please see the response to Board Interrogatory No. 4(a) for the data used to arrive at the usage profiles and weighted average for each class. A simple average of all customer consumption within each month was used to determine the average monthly consumption which was then taken as a percentage of the average annual consumption.

**Energy and Utilities Board**  
**Interrogatory No. 13**

**Reference:** Exhibit A, Schedule 2, Pages 2, 3

**Interrogatory**

Please provide exact exchange rates used in these calculations.

**Response**

The exchange rates used in the calculations were as follows:

	Jan-09	Feb-09	Mar-09	Apr-09	May-09	Jun-09	Jul-09	Aug-09	Sep-09	Oct-09	Nov-09	Dec-09

The exchange rates applicable to January and February 2009 were not traded after December 16, 2008. As a result, an average of the trading data available for November and December 2008 was used.

**Energy and Utilities Board**  
**Interrogatory No. 14**

**Reference:** Exhibit A Schedule 2 Page 3-4

**Interrogatory**

- (a) Please provide the source, including web address(es) that will be used for all market data.
- (b) Is this data publicly available?
- (c) If not please provide the fee or other restrictions for the websites that are being used.

**Response**

- (a) EGNB obtains its exchange rate and commodity price market data from Barchart.com. The web address used to acquire the data is [www2.barchart.com/mktcom.asp](http://www2.barchart.com/mktcom.asp).
- (b) The data is publicly available from Barchart.com, but only a limited number of trading days are available. EGNB captures this information on a daily basis in a spreadsheet of trading data.
- (c) See (b).

**Energy and Utilities Board**  
**Interrogatory No. 15**

**Reference:** Exhibit A, Schedule 3, Page 9-10, Residential Furnace Oil Prices

**Interrogatory**

- (a) Do the actual retail prices of furnace oil take into account retail prices in other markets where EGNB has customers (i.e. Moncton or Fredericton)?
- (b) What would be the impact of including Moncton and Fredericton in the calculation of the spread? Please provide data to support the calculations.

**Response**

- (a) The comparison between actual retail furnace oil prices and the regulated maximum price reflected prices in Saint John as indicated.
- (b) Table 1, below, presents actual retail furnace oil prices in Saint John, Moncton and Fredericton compared to the regulated maximum retail price. The actual price in these three markets averaged 0.8 cents per litre less than the regulated maximum price. The impact of including Moncton and Fredericton in the calculation of the spread would be to reduce the maximum available margin from 22.5 cents per litre to 22.2 cents per litre.

Table 1: Retail Furnace Oil Prices

**Energy and Utilities Board**  
**Interrogatory No. 16**

**Reference:** Exhibit A, Schedule 3, Page 10

**Interrogatory**

Please provide the rationale or the data to support the conclusion for expected discounts in retail price for Small Commercial, General Service, Contract General Service and Light Fuel Oil customer classes.

**Response**

As stated in the MJ Ervin Report on Page 8:

“... our model is based on “typical” discounts, as we have determined in interviews with fuel marketers. No marketer was willing (nor did we expect) to formally provide a discount schedule based on volume, since none exists. As there are no “posted” prices for other than residential (i.e. no formal rate “classes” as per EGNB), discounts can vary from one customer to another, and will vary over time according to competitive pressures.”

**Public Intervenor  
Interrogatory No. 1**

**Reference:** Background to the Market-Based Rate Setting Methodology  
Regulatory Background

**Interrogatory**

1. Please identify any Canadian or US jurisdictions that use a methodology similar to that currently employed by EGNB to develop market-based rates. Please describe any differences between the proposed EGNB formula and the formulae in place in other jurisdictions.
2. Please identify the hearing at which EGNB formally filed documentation, including details of the calculations and alternative methodologies considered, when seeking Board approval of the market-based rate setting methodology.
3. Please identify the decision arising from the hearing referenced in (2) above.

**Response**

1. EGNB has not conducted a survey of other Canadian and US jurisdictions to determine if a methodology similar to that currently employed by EGNB is used. EGNB believes the market-based rates methodology is appropriate for the New Brunswick market and is consistent with EGNB's proposal when it was awarded the general franchise for the Province.
2. EGNB filed evidence describing the market-based approach to setting rates in the NBPUB 299 proceeding in 2000. It was indicated in that evidence that the methodology being proposed was consistent with the proposal accepted by the Province in awarding the general franchise to EGNB.
3. The decision in the NBPUB 299 proceeding was issued on June 23, 2000. In that decision, the Board stated that:

“The Board recognizes that there must be an incentive for customers to switch from their existing energy source to natural gas. The Board considers that a market-based approach to establishing the target distribution rates for EGNB is appropriate during the development period. The Board also considers that “postage stamp” rates are appropriate.”

**Public Intervenor  
Interrogatory No. 2**

**Reference:** Background to the Market-Based Rate Setting Methodology  
Marketing and Promotion

**Interrogatory**

1. For the initial launch of EGNB's natural gas distribution service and for each medium used (print, television, radio, internet etc.), provide copies of the text used to inform potential customers of the benefits of switching to natural gas.
2. For each subsequent promotion program beyond the initial launch, provide the same information as requested in (1) above.
3. Please describe the \$3,500 in currently available rebates, as indicated on the EGNB website. Was this rebate program approved by the Board? Please describe how these rebates are taken into account in determining the Company's proposed market-based rate formula. Please provide all documents and spreadsheets in EGNB's possession that address the expected cost of the rebates, expected benefits and risks.

Note: For each promotion campaign, specify the medium, the text, and the date that the promotion campaign began.

**Response**

1. The information requested in this interrogatory is not readily available and would require substantial effort on the part of EGNB to assemble. More importantly, EGNB does not believe this information is relevant to the Board's examination of the elements in the market-based formula used by EGNB.
2. See 1. above.
3. The \$3,500 offer is a limited time offer that EGNB has made available to residential customers that are "on main". In addition to the standard \$3,000 incentive that is available for prospective residential customers, an additional \$500 has been made available for customers that sign up for natural gas service by March 31, 2009. This limited time offer has been put in place to stimulate signing activity by "on main" prospective customers during the winter months. Encouraging conversion activity at this time of year assists in the scheduling of construction resources during the later part of the winter and early spring, a time period when activity levels are traditionally slower.

This incentive program, as with other incentive programs, does not require approval by the Board. On July 20, 2006, the Board issued a "Policy re Customer Incentives" that EGNB uses as a guide for establishing its incentive programs. EGNB believes that this program is consistent with that Policy.

This rebate program and other incentive programs were not taken into account in determining the proposed formula.

**Public Intervenor  
Interrogatory No. 3**

**Reference:** Background to the Market-Based Rate Setting Methodology  
Target Savings

**Interrogatory**

1. For each customer class, describe the conditions that would have to exist in order for customers in that class to actually receive the targeted savings promised by EGNB.
2. For each customer class, what would be the probability that customers in that class would actually receive the targeted savings? Provide calculations to support your answer.

**Response**

1. EGNB's market-based rates formula is intended to provide a typical customer with the ability to achieve a target level of savings. EGNB does not "promise" that all customers will achieve that level of savings as suggested in the question.

There are a number of situations that could occur that would cause a customer in a class to receive or exceed the targeted savings. Simplistically, if all of their historic and current operating parameters matched those in the formula, they would achieve the target savings. However, there is significant interplay between the variables in the formula. For example, if their historic oil pricing was greater than that assumed by EGNB, but their efficiency gain was less, they may still achieve, or exceed, target savings. Similarly, if their actual consumption was greater than that in the formula, but their natural gas commodity price was higher, they may still achieve, or exceed, target savings.

It is not possible to describe all of the possible situations and permutations that could exist that would allow customers to receive or exceed the target savings. The purpose of the formula is to use a typical customer profile and pricing information to provide a means of developing a rate that would allow a customer with the same characteristics to achieve the savings.

2. Given the number of permutations of customer circumstances related to different elements in the formula that could provide them with the ability to achieve or exceed target savings, EGNB is unable to determine the requested probability.

**Public Intervenor  
Interrogatory No. 4**

**Reference:** Objectives of Market-Based Rate Formula

**Interrogatory**

1. What objectives does EGNB believe should guide the specification of the market-based formula?
2. Were these the objectives used by EGNB to develop its proposal for the formula filed on January 26, 2009?
3. Please provide any internal documents in EGNB's possession relating to the formation of its opinion on the objectives of the market-based rate formula. Such documents should include preliminary or final drafts of correspondence, letters, telegrams, facsimile transmissions, email communications, memoranda, reports, notes, minutes, agendas, notices and any other relevant documents.

**Response**

1. EGNB believes that the key objectives of the market-based formula are:
  - i.) provide customers with a sufficient level of savings to incent the conversion to and continued use of natural gas; and
  - ii.) minimize additions to the deferral account.
2. Yes.
3. EGNB is not aware of any such documents. These objectives are consistent with the original proposal filed with the Province in 1999 and have guided EGNB's rate setting activities since that time.

**Public Intervenor  
Interrogatory No. 5**

**Reference:** Objectives of Market-Based Rate Formula

EGNB witness Charleson states on Exhibit A, page 11 that:

“EGNB is proposing that the Board approved savings levels continue to be used. These savings levels have been approved by the Board based on the evidence presented in prior rate cases that the savings level struck a balance between providing sufficient incentive to convert to natural gas and recovering as much of EGNB’s costs as possible during the development period. EGNB believes that the current savings levels will continue to provide a sufficient incentive for customers to convert to and continue to use natural gas, while also minimizing additions to the deferral account.”

**Interrogatory**

1. Is it EGNB’s position that its proposed market-based rate formula provides an appropriate incentive for all customers to convert to and to continue using natural gas?

**Response**

1. Yes.

**Public Intervenor  
Interrogatory No. 6**

**Reference:** Objectives of Market-Based Rate Formula  
Fixed Price Offer and Enbridge Variable Product

**Interrogatory**

1. What were the objectives behind EGNB's development of a Fixed Price Offer for EUG commodity service? Are these different from the objectives used in setting the proposed formula rate for delivery service? Please describe any differences and the rationale for such differences.
2. What were the objectives behind EGNB's development of an Enbridge Variable Product for commodity service? Are these different from the objectives used in setting the proposed formula rate for delivery service? Please describe any differences and the rationale for such differences.
3. Please provide all analysis performed by EGNB and all data reviewed by EGNB in connection with the introduction of a Fixed Price Offer and Enbridge Variable Product for EUG commodity service. Please provide all internal documents in EGNB's possession relating to the formation of its opinion on the objectives of the EUG Fixed Price Offer and the Enbridge Variable Product. Such documents should include preliminary or final drafts of correspondence, letters, telegrams, facsimile transmissions, email communications, memoranda, reports, notes, minutes, agendas, notices and any other relevant documents.
4. Has EGNB's introduced any other EUG commodity service pricing offers other than the Fixed Price Offer, Standard Offer and Enbridge Variable Product? If so, please list each pricing offer and terms. Please describe the rationale for electing to make such a pricing offer available to customers and provide all data reviewed by and analysis performed by EGNB in connection with the evaluation of new pricing offers.
5. Was one objective behind the introduction of a Fixed Price Offer for EUG commodity service to reduce the volatility of gas costs for customers? Is this a concern for EGNB when developing the market-based rate formula for delivery service? What priority is given by EGNB to reducing volatility? How is this taken into account in the January 26 proposal? Please provide all internal documents in EGNB's possession related to EGNB's consideration of volatility in the delivery rate formula, including preliminary or final drafts of correspondence, letters, telegrams, facsimile transmissions, email communications, memoranda, reports, notes, minutes, agendas, notices and any other relevant documents.

## Response

1. The objective behind EGNB's development of the Fixed Price Offer was to provide a commodity offering that provided customers with certainty regarding their commodity costs for a 12 month period. This objective differs from the objectives used in setting the formula, as the formula objectives are related to the ability to achieve target savings and minimizing additions to the deferral account.
2. The objectives behind EGNB's development of the Enbridge Variable Product ("EVP") was to provide a commodity offering for commercial customers that EGNB believed provided pricing that was comparable to the manner in which many larger customers acquire supply in other markets and was similar to the manner in which EGNB acquires its own supply. EVP also provided the customer with pricing through a transparent formula that was simple for the customer to forecast forward for budget purposes. By providing EVP, EGNB provides more choice to commercial customers.
3. EGNB does not believe analysis performed regarding the Fixed Price Offer is relevant to the Board's examination of the elements in the market-based formula used by EGNB. The analysis performed regarding EVP related to the structure of the pricing for EVP. This is seen in EGNB's response to AWL Interrogatory No. 4. EGNB does not have any other documents related to the development of EVP.
4. EGNB also provides an Off-Peak service commodity offering that is only available to customers taking service under its off-peak rates. This product was made available in recognition of the fact that other EGNB commodity offerings factor in the impact of winter basis spreads. Since the Off-Peak service commodity offering is only available for consumption outside of the winter months, it provides a price that is more indicative of what pricing these customers should see. The Off-Peak product is priced at NYMEX + US\$1.25/mmbtu, with a surcharge of US\$3.00/mmbtu applied to any gas consumed between December and March inclusive.
5. As indicated in the response to 1 above, reducing the volatility of gas costs was the main objective behind the introduction of the Fixed Price Offer. This however was not a concern in developing the market-based rate formula for delivery service as there were differing objectives behind the formula development. While providing a certain degree of rate stability is preferable, the ability for a typical customer to achieve target savings is the principal concern for EGNB in setting its rates. The introduction of the Fixed Price Offer supported a desire to provide more choice with regards to commodity offerings in the market.

**Public Intervenor  
Interrogatory No. 7**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives

**Interrogatory**

1. Is it true that EGNB's value proposition and proposal rate formula is based on the total delivered cost of natural gas, including the commodity component and the delivery component?
2. How did EGNB account for the different pricing choices for commodity services that are available to customers when EGNB designed the proposed delivery service market-based rate formula filed with the Board on January 26, 2009?

**Response**

1. Yes.
2. EGNB does not account for the different commodity pricing services that are available to customers when examining and designing the elements in the proposed market-based rate formula. As EGNB indicated in its evidence, EGNB proposes to "use EUG and EVP prices as they are both publicly available in the marketplace and representative of the type of pricing that customers within the rate classes are able to obtain." The transparency of the price information is one of the critical elements in establishing the formula. By using a price that is generally available in the marketplace, customers have the ability to compare the EUG and EVP price against other offerings in the market and identify if they may be able to obtain a lower price or something that fits better with their appetite for risk related to commodity pricing.

Given the transparency of EUG and EVP pricing, these may reasonably be considered the maximum rate that customers would pay, outside of a premium they may be willing to pay for another offering (e.g. price certainty through a fixed price). As a result, to the extent that customers can contract for commodity at a lower price, they will increase the level of savings they can achieve.

**Public Intervenor  
Interrogatory No. 8**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Alternatives to the Standard Offer

**Interrogatory**

1. If a customer elects to take the EUG Fixed Price Offer, how does EGNB's proposed formula take this into consideration when setting the distribution rate? Is EGNB's proposal to use that customer's fixed EUG price as the input for commodity cost in the rate formula? If not, why not?
2. Did EGNB consider implementing a different distribution rate for customers who take the Fixed Price Offer as compared to the Standard Offer? If not, why not? If yes, please discuss how EGNB evaluated this possibility and what EGNB deemed the pros and cons of each alternative to be. What rationale did EGNB use to support its final decision on this matter?
3. What would be the impacts on a customer's incentive to convert to and to continue using natural gas:
  - i. If EGNB were to use a customer-specific EUG price for customers taking the Fixed Price Offer?
  - ii. If EGNB were to use the Standard Offer EUG price for customers taking the Fixed Price Offer?
4. Assume, for example, that a customer locks in a Fixed Price Offer from EUG when market prices for natural gas and oil are relatively high. Assume then that the market prices for both gas and oil fall. Won't that customer's total cost of delivered gas appear unattractive relative to the cost of procuring oil at the current lower market prices? In this case, won't EGNB fail to meet its value proposition of offering an incentive both to convert to and to continue using natural gas?

**Response**

1. EGNB's proposed formula does not take the EUG Fixed Price Offer into consideration when setting the distribution rate, in the same way that EGNB does not factor in the pricing of marketers like Irving and Park Fuels. The EUG standard offer is used as the basis for establishing the delivery rates as it is the predominant EUG offering used by EGNB customers. Also, since the Fixed Price Offer has only been offered in the fall for a November 1 start date it does not provide the necessary forward view of market conditions throughout the year. The standard EUG offer adjusts on a monthly basis to

reflect changes in commodity market conditions. This provides a forward 12 month forecast at all times, which is required to identify the requirement for any rate riders.

2. EGNB did not consider implementing a different distribution rate for customers who take the Fixed Price Offer, the same as it has not considered implementing a different distribution rate for customers who take commodity service from someone other than EGNB. The purpose of using EUG is to have a transparent commodity cost that provides a forward 12 month view at any point in time that would reflect what a typical customer would pay for commodity.
3. The impact on a customer's incentive to convert to and continue using gas could only be assessed at the end of the period that the Fixed Price Offer was available. To the extent that on average the standard EUG price was above the Fixed Priced Offer during the term of the agreement, the customer would achieve greater savings if the standard EUG price is used to establish their delivery rate than if a "customer-specific" rate was established using the Fixed Price Offer, thereby increasing their incentive to convert to and continue to use natural gas. Conversely, if the standard EUG price was on average below the Fixed Price Offer, the customer would achieve greater savings if their delivery rate was established using the Fixed Price Offer.

It is important to note that EGNB does not believe it is feasible or practical to establish delivery rates on a "customer-specific" basis.

4. It is true that if both oil and natural gas prices fall after a customer locks into a Fixed Price Offer they will achieve a lower level of savings than EGNB targets for a typical customer. Similarly, if natural gas prices rose after a customer locks into a Fixed Price Offer they will achieve greater savings than EGNB targets for a typical customer. However, customers choosing the Fixed Price Offer will have reduced the risk of volatility in their natural gas commodity price. This may carry more value for a customer than achieving the target level of savings. It is on the same basis that customers choose to acquire their commodity from someone other than EGNB. Some customers may equate value to the terms of a particular commodity offering that goes beyond the price being offered. EGNB cannot quantify these considerations into the derivation of delivery rates.

**Public Intervenor  
Interrogatory No. 9**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Pricing

**Interrogatory**

1. Please provide, in spreadsheet form, historic pricing for EUG's Standard Offer, Fixed Price Offer and all other EUG commodity offers from the date such offers were first made available to customers through February 1, 2009.
2. Please provide a detailed explanation for how EGNB determines the price of the EUG Fixed Price Offer. Is it based on forward prices for natural gas? Is there a profit margin embedded in the price? Is a premium included for the risks that EGNB takes by offering a fixed-price service? Does EGNB make up in future rate periods any shortfalls in commodity revenue received from customers taking the Fixed Price Offer and the actual costs of supplying the gas commodity to those customers? Does EGNB credit back in future rate periods any excess commodity revenue received from customers taking the Fixed Price Offer over and above the actual costs of supplying the gas commodity to those customers? Does EGNB hedge the risks of supplying customers under a Fixed Price Offer? If so, how does EGNB hedge those risks? Please provide all spreadsheets used by EGNB to formulate the Fixed Price Offer and to manage its implementation.
3. Please provide a detailed explanation for how EGNB determines the price of the Enbridge Variable Product. Is a premium included for the risks that EGNB takes by offering this product? Does EGNB make up in future rate periods any shortfalls in commodity revenue received from customers taking the Enbridge Variable Product and the actual costs of supplying the gas commodity to those customers? Does EGNB credit back in future rate periods any excess commodity revenue received from customers taking the Enbridge Variable Product over and above the actual costs of supplying the gas commodity to those customers? What risks does EGNB bear in supplying customers under the Enbridge Variable Product? Does EGNB hedge any of those risks? Please provide all spreadsheets used by EGNB to formulate the Fixed Price Offer and to manage its implementation.
4. Do EGNB's regulatory financial statements, as filed with the Board, include the revenues and costs associated with providing EUG commodity services? If not, why not? Please provide a copy of the financial statements that include the profit and loss, cash flow and asset/liability positions related to EGNB's EUG commodity services for each fiscal year since 2003.

**Response**

1. The historic pricing of the different commodity offerings by EGNB are shown in the table below:

<b>Effective Date</b>	<b>EUG</b>	<b>Off-Peak</b>	<b>EVP</b>	<b>Fixed Price</b>

2. EGNB provides supply for this offering by entering into a physical supply agreement for a volume of gas that will support the expected interest in the Fixed Price Offer at a price that is fixed for the contract term with the supplier. An additional charge is then added to cover volumetric risk and administrative costs associated with this offering. The product is priced in a manner that it recovers all of its costs, with no potential for a shortfall in the commodity revenue received from the customers being supplied by the Fixed Price Offer. Any excess revenues that arise would be related to lower than anticipated administration costs or volumetric fluctuations. These revenues are credited back to the Purchase Gas Variance Account (PGVA) which will flow as a credit to the EUG price.

EGNB does not make any adjustments in future rate periods to account for any shortfalls or surpluses, as this is handled monthly through PGVA balance adjustments using aggregated results from all combined alternate products.

3. As indicated in A27 of EGNB's evidence, EVP is priced based on the monthly NYMEX price plus a market spread that is currently set at US\$2.25/mmbtu. Please see the

response to AWL Interrogatory No. 4 for an explanation on how the market spread is established. The product is priced in a manner that it recovers all of its costs within the current period, with no potential for a shortfall in the commodity revenue received from the customers being supplied by EVP. Any excess revenues that arise would be related to lower than anticipated administration, basis or exchange rate costs. These revenues are credited back to the PGVA which will flow as a credit to the EUG price.

EGNB believes that it bears no risk in supplying customers under EVP due to the manner in which the price is structured and the nature of the gas supply contract that is used to support EVP deliveries. Similarly, because of the nature of the gas supply contract, it is not necessary for EGNB to hedge any aspect of the offering.

4. EGNB's regulatory financial statements, as filed with the Board, do not include the revenues and costs associated with providing EUG commodity services as these costs and revenues do not form part of the revenue requirement that is subject to regulation. EGNB files this information with the Board on an annual basis as part of its Commodity Sales report. A copy of the 2007 report is attached to this response.

**Public Intervenor  
Interrogatory No. 10**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Customer Data

**Interrogatory**

1. How many customers in each EGNB rate class and what corresponding gas volumes are currently being served under the Fixed Price Offer from EUG?
2. How many customers in each EGNB rate class and what corresponding gas volumes are currently being served under the Enbridge Variable Product from EUG?
3. Please provide a table showing for each rate class
  - i. Name of the rate class,
  - ii. Total number of customers and aggregate annual gas usage,
  - iii. Number of customers in that class taking commodity service from EUG and their aggregate annual gas usage,
  - iv. Breakdown showing which customers in iii. above are taking each commodity offer available from EUG and the associated gas usage for each commodity offer,
  - v. Number of customers in that class taking commodity service from an Enbridge affiliate and their aggregate annual gas usage, and
  - vi. Number of customers in that class taking commodity service from unaffiliated gas marketers and their aggregate annual gas usage.

**Response**

EGNB wishes to clarify the information presented in the table on page 15 of its evidence. The column showing the utilization of EUG incorporates the percentage of customers using both the Standard Offer and the Fixed Price Offer. As can be seen in the table below, the Standard Offer is the predominant product used by 57% of EGNB customers in comparison to the 12% that use the Fixed Price Offer. Additionally, in preparing this response, EGNB identified one LFO EUG customer that had inadvertently been counted as using EVP. As such, the percentage of LFO customers on EUG should be 5% and with EVP should be 20%. An updated version of the table reflecting these adjustments is shown below.

Rate Class	EUG	EVP	Others
SGSRE	54%	0%	46%
SGSRO	67%	0%	33%
SGSC	54%	0%	46%
GS	36%	0%	64%
CGS	24%	1%	75%
LFO	5%	20%	75%
HFO	0%	14%	86%
<b>Total</b>	<b>57%</b>	<b>0%</b>	<b>43%</b>

The requested information is shown in the table below:

Rate Class	EUG			Fixed Price Offer			EVP			Off-Peak			Other Marketer			Total		
	Customers #	%	Annual Usage	Customers #	%	Annual Usage	Customers #	%	Annual Usage	Customers #	%	Annual Usage	Customers #	%	Annual Usage	Customers #	%	Annual Usage

Notes:

1. There are no Enbridge affiliates offering commodity services in the New Brunswick market.
2. There is one customer that has made an alternate supply arrangement through EGNB that does not fall within the standard offers. This arrangement was put in place to meet the specific needs of the customer. EGNB has not included the customer or their usage in the table as providing this may identify the customer and their consumption.

**Public Intervenor  
Interrogatory No. 11**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Pricing Options Data

**Interrogatory**

1. Please provide all data reviewed by EGNB and all analysis performed by EGNB related to pricing options (e.g., fixed price for a given term, variable price resetting with a given frequency) available to and chosen by customers who choose a fuel other than natural gas. Please address each rate class and each alternate fuel covered by EGNB's January 26, 2009 proposal for a market-based rate formula.
2. Please provide all data reviewed by MJ Ervin and all analysis performed by MJ Ervin related to pricing options (e.g., fixed price for a given term, variable price resetting with a given frequency) available to and chosen by customers who choose a fuel other than natural gas. Please address each rate class and each alternate fuel covered by EGNB's January 26, 2009 proposal for a market-based rate formula.
3. Please explain how the pricing options available to and chosen by customers who choose a fuel other than natural gas are taken into account in EGNB's January 26, 2009 proposal for a market-based rate formula? For example, if EGNB determined that customers taking other fuels lock in their commodity prices for a year or a season at a time at a given time of year, how does EGNB's proposed formula take this into account and meet EGNB's value proposition for such customers? Please address all rate classes and all commodity pricing options available to customers.

**Response**

1. EGNB has not reviewed data or conducted any analysis related to pricing options available to and chosen by customers who choose a fuel other than natural gas.
2. MJ Ervin & Associates did not complete any analysis relating to pricing options. Such analysis was beyond the scope of MJ Ervin & Associates engagement which was to assist EGNB in the determination of wholesale and retail distillate fuel prices in New Brunswick to be used in its formula to establish market-based natural gas delivery rates. MJ Ervin & Associates did not examine any other fuels besides retail distillate oil in the scope of their engagement.
3. EGNB did not consider the pricing options available to and chosen by customers who choose a fuel other than natural gas in developing its proposal for the market-based rate formula. As there is little transparency regarding alternate fuel pricing, EGNB

incorporated a forward 12 month view of oil and electricity pricing as its best estimate of the expected alternate fuel cost for a typical customer.

**Public Intervenor  
Interrogatory No. 12**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Customers Not Taking Service

**Interrogatory**

1. For all customers eligible to use natural gas who have elected *not* to use natural gas, please provide EGNB's best estimate with regard to the following questions:
  - i. How many customers and how much demand are in the eligible class? In other words, if EGNB were to achieve 100% penetration in each rate class, how much higher would its customer numbers and demand numbers be by rate class?
  - ii. For all customers in (i)., what percentage of customers and what percentage of eligible demand does EGNB estimate is being supplied an alternative fuel under a fixed-price supply arrangement? For what duration does EGNB estimate that those customers have locked in a fixed price for that alternative fuel? What does EGNB estimate the timing of that purchase decision for customers in each rate class choosing an alternative fuel, e.g., do the customers lock in a price for the upcoming season or year at a particular time of year? Does EGNB believe there is an open season during which customers negotiate with marketers? If so, when is that open season and for which fuels and customer types?
  - iii. For all customers in (i)., what percentage of customers and what percentage of eligible demand does EGNB estimate is being supplied an alternative fuel under a variable-price arrangement? What does EGNB estimate to be the frequency with which those rates reset for the alternative fuel?
  - iv. Please provide all backup calculations and data used to form EGNB's opinions for (i), (ii), and (iii). above.
  - v. Please provide the best estimate of EGNB's consultant MJ Ervin with respect to questions (i), (ii), and (iii). above. Please provide all backup calculations and data used to form the opinion of MJ Ervin for (i), (ii), and (iii) above.
2. Has EGNB examined non-price terms associated with the supply of alternate fuels as compared to the supply of natural gas under the EGNB delivery tariff and terms of EUG or alternative marketer commodity service? If not, why not? If so, please provide all analyses performed by or reviewed by EGNB in this regard.
3. Does EGNB believe that non-price terms could impact a customer's decision on whether to take natural gas as compared to an alternative fuel? What non-price terms does EGNB consider to be most important? Why? How has EGNB taken into account non-price differences in the development of its proposed formula?

4. Has EGNB or any of its consultants surveyed customers to understand what drives their fuel purchase decision making, what their actual alternative fuel costs are or how customers measure savings? If yes, please provide a copy of the survey and results of the survey. If no, why not?
5. Please provide all market research studies related to customer fuel purchasing decisions that EGNB has performed or reviewed during the past five years.

## Response

1.
  - i.) The following table identifies the number of customers that EGNB estimates as currently not being captured within the markets it serves. EGNB has made the following assumptions:
    - For the residential rate classes, the estimate is based on the number of non-customers where EGNB currently has main in place. The breakdown between SGSRE and SGSRO is based on fuel usage of residential customers.
    - For the commercial rate classes, the estimates are based on the total number of businesses within the communities served by EGNB based on market data received by EGNB in 2006, with home based businesses excluded (those with 1-2 employees). The breakdown between rate classes is based on the existing distribution of customers between these classes, adjusted downwards for the larger classes as EGNB believes it has achieved greater penetration with these businesses. EGNB uses a different assumption for commercial customers than residential customers as it is more likely to extend its main to reach the load available from commercial customers.
    - The LFO and HFO classes have been estimated based on EGNB's understanding of the current market potential.
    - The potential demand has been estimated by applying the typical customer consumption as EGNB has no specific knowledge of the actual potential demand for all of these customers:

	Customers	TJs
SGSRE	11,779	1,307
SGSRO	4,478	376
SGSC	2,314	516
GS	1,671	1,526
CGS	300	1,484
LFO	3	100
HFO	1	132
	20,546	5,442

- ii.) EGNB does not have any market information regarding alternative fuel offerings and as a result is unable to determine the requested information.
  - iii.) See ii.) above.

- iv.) The assumptions underpinning i.) have been indicated in the response to part i.).
  - v.) MJ Ervin & Associates did not examine any other fuels besides retail distillate oil in the scope of their engagement. MJ Ervin & Associates cannot provide an estimate with respect to part i.) as they did not complete any analysis on furnace oil demand within New Brunswick. Such analysis was beyond the scope of their engagement, which was to assist EGNB in the determination of wholesale and retail distillate fuel prices in New Brunswick to be used in its formula to establish market-based natural gas delivery rates. With respect to questions ii.) and iii.), while MJ Ervin & Associates cannot estimate the percentages requested, as such analysis was beyond the scope of their engagement, the discussions they have had with marketers would indicate that most, if not all, furnace oil is purchased under a variable versus fixed-price arrangement, with prices fluctuating at time of delivery.
2. EGNB has not examined the non-price terms associated with the supply of alternate fuels as compared to the supply of natural gas. During the sales process, EGNB will typically review current energy costs with the customer and estimate what these costs would look like if they were using natural gas. This does not require understanding the detailed terms and conditions associated with the supply of the alternate fuel. It also does not play any role in estimating the alternate fuel price for the derivation of the distribution rate.
  3. EGNB believes that the principle driver behind most customers' decision to convert to natural gas will be the potential savings and environmental benefits achieved through the conversion. EGNB is aware of some circumstances where the loss of volume discounts on their alternate fuel purchases at other facilities that do not have access to gas may deter a customer from converting to gas. However, this is not typical and EGNB believes this issue cannot be addressed by any rate setting mechanism. As a result, EGNB has not given any consideration to the impact that non-price terms may have on a customer's decision in developing its proposed formula.
  4. EGNB has not surveyed customers to understand what drives their fuel purchase decisions as it believes it has sufficient anecdotal evidence from customers to understand these aspects. EGNB does collect information from commercial customers during the sales process regarding their alternate fuel cost (to do the savings analysis), but does not consolidate this information for the purpose of analysis. EGNB is also aware that some customers track before and after consumption and costs for the purpose of assessing their savings.
  5. EGNB has not conducted any studies on customer fuel purchasing decisions during the past five years.

**Public Intervenor  
Interrogatory No. 13**

**Reference:** Impact of Pricing of Commodity Services on Ability of Formula to Meet Objectives  
Delivering Target Savings

**Interrogatory**

1. Does EGNB have any customer research or analysis that supports the proposition that the proposed formula will deliver the target savings for existing and potential customers? If yes, please provide a copy of this analysis. If no, why not?
2. Please provide all backcasting analyses performed by EGNB or its consultants that evaluate the level of savings achieved by the market-based rate formula, since the market-based rate methodology was implemented. If no such analyses exist, please explain why EGNB has not backcast the formula to determine the level of savings actually achieved by customers.
3. Please provide all studies related to the price elasticity of demand of natural gas customers that have been reviewed by or performed by EGNB or MJ Ervin during the past five years. Did EGNB rely on any of these studies when formulating its January 26 recommendation for the market-based rate formula? Why or why not?

**Response**

1. EGNB relies on the derivation table as the basis that the formula will deliver the target savings for typical existing and potential customers. All of the variables used within the table are either based on market information, customer data or reasonable estimates based on industry information and standard conversion factors.
2. EGNB monitors and reviews anticipated and achieved target savings on a regular basis. The following table provides this analysis since 2002:

<b>Historic Savings (%)</b>							
<b>Rate</b>	<b>2002</b>	<b>2003</b>	<b>2004</b>	<b>2005</b>	<b>2006</b>	<b>2007</b>	<b>2008</b>
SGS	33%	40%	28%	28%	22%		
SGSRO						18%	23%
SGSRE						21%	20%
SGSC						18%	25%
GS	30%	39%	25%	29%	13%	18%	16%
CGS	21%	35%	22%	27%	18%	21%	29%

- EGNB did not review or perform any studies related to the price elasticity of demand of natural gas customers. In addition, MJ Ervin & Associates has not performed or reviewed any studies related to the price elasticity of demand for natural gas during the past five years. The purpose of the market-based rates formula is to provide target savings for typical natural gas customers. Price elasticity was not a consideration in determining a mechanism for achieving this.

**Public Intervenor  
Interrogatory No. 14**

**Reference:** Calculation of the Formula  
Target Savings / Residential Oil vs. Residential Electricity / Market Spreads

**Interrogatory**

1. Is the EGNB proposed formula designed to deliver the target savings for existing EGNB customers, for prospective EGNB customers, or both?
2. In formulating its January 26 recommendation, did EGNB consider combining the residential oil and residential electricity classes? What does EGNB view to be the costs and benefits of continuing to separate these customers in distinct classes as compared to combining them in a single class? Please provide all workpapers, analysis, and internal company documents that relate to EGNB's opinion on this subject.
3. With reference to Question and Answer 27, on Page 13 of the Evidence:
  - i. What is the basis for the \$2.25/MMBTU market spread?
  - ii. Please provide all spreadsheets, workpapers and other documents that EGNB has reviewed or relied upon in determining that market spread.

**Response**

1. Both.
2. EGNB did not consider combining the residential oil and residential electricity classes in formulating its recommendation. Given the current volatility in commodity markets and the disparity between the market-based SGSRO and SGSRE delivery rates, combining the classes would result in one class of customer either receiving greater than target savings, which would contribute unnecessary additions to the deferral or less than target savings which may negatively impact the ability to incent customers to convert to and continue using natural gas.
3. Please see the response to Public Intervenor Interrogatory No. 9 part 3.

**Public Intervenor  
Interrogatory No. 15**

**Reference:** Calculation of the Formula  
Potential Variability of Assumptions With Respect to Oil-Based Rates

**Interrogatory**

For each assumption used in EGNB's proposed formulae for oil-based rates, please provide EGNB's best estimate of the potential variability of the assumption in question. At the very least, specify the following for the Derivation Table - Oil in Schedule 2, Page 1 of 4

1. What is EGNB's best estimate of the potential variability of the retail oil price used in line 1? Please address both how much EGNB would expect an individual customer's energy price to differ from the class average and what the variability of the retail energy price itself is over time. Please express the variability of the retail price itself as an annualized volatility. Please distinguish, where appropriate, between the variability for existing EGNB customers and variability for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

2. What is EGNB's best estimate of the range of actual efficiencies used by customers in each class? Is the estimate in line 2 intended to be the average efficiency for the class, the median efficiency? Please address how much the efficiency factor for an individual customer could differ from the class average and what the degree of error with respect to the accuracy of EGNB's estimate of the class average is. Please distinguish, where appropriate, between the range for existing EGNB customers and range for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

3. What is EGNB's best estimate of the range of the typical annual consumption used in line 3 for each class? Please address how much the typical annual consumption for an individual customer could differ from the class average and what the expected degree of error is with respect to the accuracy of EGNB's estimate of the class average. By how much would the annual consumption for each customer class typically be expected to

vary due to weather, economic conditions and other factors that EGNB believes impact consumption? Please distinguish, where appropriate, between the range of consumption and variability for existing EGNB customers and range of consumption and variability for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

4. What is EGNB's best estimate of the potential variability of the Typical Natural Gas Consumption used in line 10? Please address by how much the Typical Natural Gas Consumption for an individual customer could differ from the class average and what the degree of error is with respect to the accuracy of EGNB's estimate of the class average. By how much would the Typical Natural Gas Consumption typically be expected to vary in a year for each customer class due to weather, economic conditions and other factors that EGNB believes impact consumption? Please distinguish, where appropriate, between the range of consumption and variability for existing EGNB customers and the range of consumption and variability for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

5. What is EGNB's best estimate of the potential variability of the Commodity Cost used in line 12? Please address how much the Commodity Cost for an individual customer could differ from the class average and what the degree of error is with respect to the accuracy of EGNB's estimate of the class average Commodity Cost. Please also provide EGNB's best estimate of the annualized volatility of the Commodity Cost by customer class. Please distinguish, where appropriate, between the variability for existing EGNB customers and variability for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

6. Please provide EGNB's forecast of the annualized volatility of the Target Distribution Rate by rate class. Please explain how correlations between the formula inputs were accounted for in arriving at the estimate of the volatility of the Target Distribution Rate. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

7. Please provide EGNB's calculation of the historic annualized volatility of the distribution rate, by year and by rate class. Please compare and contrast the historic volatility to the forecast volatility. Does EGNB believe that the proposed revisions to the formula will increase or decrease volatility for each rate class? Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

8. In Derivation Table - Oil in Schedule 2, Page 1 of 4, please specify which Commodity Cost estimates are EUG and which are EVP.

## Response

Some principles apply equally to all aspects of the formula. First, EGNB would anticipate that the degree of variability in any formula element experienced by potential EGNB customers would be the same as that experienced by existing customers as they would be influenced by similar market and operating conditions.

EGNB monitors the target savings levels provided by the formula on a weekly basis, by applying the most recent market data to the retail oil and natural gas prices to assess if targeted savings are being achieved on an annual basis. If EGNB determines that market conditions have changed such that target savings may not be achieved, or greater than target savings may be achieved, it can file an application to adjust these rates through a rate rider.

1. EGNB has not conducted any analysis on the potential variability of retail oil prices. As a result EGNB is not in a position to estimate the variability that has been requested.

The variability of the retail oil price will have a direct relationship with the variability being seen in the New York Harbour No. 2 oil price and the US/CDN exchange rate. As has been seen over the past year, there has been a high degree of volatility in wholesale oil prices and exchange rates. Over the past 12 months the wholesale spot price has varied between a maximum on July 3, 2008 of US\$4.0833/gallon and a minimum of US\$1.2125/gallon on December 24, 2008, 237% volatility. This volatility has also been seen in the maximum retail prices approved by the Board, which have ranged between CDN\$0.718/litre on January 1, 2009 and CDN\$1.475/litre on July 10, 2008.

EGNB is unable to assess the individual variability that a customer may see between the energy price that they pay and the maximum retail price over time as there is no transparency regarding these retail prices.

2. EGNB is unable to estimate the range of the actual efficiencies of the oil equipment being used by customers prior to conversion in each class as it does not have access to this information. Please see the response to Board Interrogatory No. 5(a) for additional clarity on EGNB's assumptions regarding oil efficiencies.

The table attached to Board Interrogatory No. 5(b) indicates that the efficiency of the natural gas heating equipment that has been installed by EGNB ranges from 82% to 99% for boilers, 92% to 97% for furnaces, 78% to 83% for Rooftop Units and 80% to 82% for Unit Heaters. Water Heaters have ranged from 57% to 96%.

The efficiency factors used in line 2 are intended to reflect the average efficiency gain within the class based on the predominant equipment used to serve that class. In the case of residential and small commercial, furnace efficiencies are the principal drivers behind the efficiency factor. For larger commercial customers, equipment other than furnaces is more predominant.

The efficiency factor for an individual customer can vary greatly from the class average, especially in commercial applications. For example, in the GS and CGS markets there are customers who operate very inefficient old hot water and steam space heating systems. Boilers can be located in unheated areas with little or no pipe insulation distributing hot water or steam to unit heaters located at the ceiling. Not only are the boilers themselves inefficient but the heat distribution system is inefficient. Switching to radiant tube heaters in a case like this can reduce the amount of energy required to heat the building by more than 50%. In other cases, newer more efficient oil equipment may be replaced to obtain other benefits from converting to natural gas (e.g. lower maintenance costs, no on-site fuel storage, etc.). Given the number of variables that can affect the efficiency gain, EGNB is unable to estimate the degree of variability that may occur.

3. The typical annual consumption shown in line 3 is the estimated oil consumption in GJs/year which is estimated based on the typical annual natural gas consumption shown in line 10 and applying the assumed efficiency factors seen in line 2. Since any differences in the annual consumption will be directly related to differences seen in line 10, EGNB has responded to these questions based on information available regarding natural gas consumption.

Please see the data provided in the response to Board Interrogatory No. 4(a) for information regarding the degree to which typical annual consumption for an individual customer could differ from the class average.

The degree to which customer consumption may vary due to weather will be largely dependent on the degree to which the customer's load is temperature sensitive. EGNB

breaks down customer consumption into two categories: Temperature Sensitive Load (TSL); and Base Load (BL) (or non-temperature sensitive load). This breakdown is based on EGNB's understanding of the equipment that each customer has and the use of that equipment. The following table provides a summary by rate class of how EGNB estimates the customer base is broken down between these categories.

2008 Consumption – Base load vs Temperature Sensitive load

Rate Class	Base Load %	Temp. Sensitive Load %
SGS-RE	28.8	71.2
SGS-RO	22.5	77.5
SGS-C	20.6	79.4
GS	26.9	73.1
CGS	31.3	68.7
LFO	93.6	6.4
HFO	35.4	64.6

As the category name implies, TSL is susceptible to variation due to weather. The effect weather has on TSL depends on the time of year. For example, an unusually cold January will have a much more significant impact on TSL than an unusually cold June where most people have already turned their heat off for the summer. As opposed to TSL, BL tends to be affected by economic factors as this consumption is driven by the use of processing machinery and in water heating.

Predicting how factors like weather and the economy will affect customer consumption is not easily done. When EGNB forecasts customer consumption it uses a system of degree days (a measure of variance of temperature between the reference value of 18°C and the average outside temperature for that day. The value of 18°C is taken as a reference point because experience shows that if the outside temperature is this value then no heating or cooling is normally required) where, based on history, a forecast of weather is tied to TSL consumption. These same degree days are then used when explaining variances in consumption after the fact. Again timing is also a factor with weather so when the colder or warmer weather occurs will determine how effective degree days are at predicting consumption.

Given the complexity and wide range of assumptions that may be considered, EGNB is unable to estimate the variability in customer load due to economic conditions and other factors.

4. Please see the response to Board Interrogatory No. 4(a) for the degree of variability seen in existing customer natural gas consumption and how these differ from the class average. Please see 3. above regarding factors that can influence the variability.

5. EGNB is not able to estimate the potential variability that a customer may see in their commodity cost as there is a lack of transparency in the commodity costs experienced by customers that do not use an EGNB commodity offering.
6. EGNB does not forecast the annualized volatility of the Target Distribution Rate by rate class. The Target Distribution Rate will move in direct relationship to changes in retail oil and natural gas commodity costs.
7. The following table shows the effective delivery rates for each rate class by month and the volatility of the rates each year:

<b>Delivery Rate (\$/GJ)</b>								
<b>Month</b>	<b>SGS</b>	<b>SGSRE</b>	<b>SGSRO</b>	<b>SGSC</b>	<b>GS</b>	<b>CGS</b>	<b>LFO (Block 1)</b>	<b>HFO</b>

Since EGNB forecasts future rates on an annual basis, the forecast volatility in future years would be zero.

Historic changes in the delivery rates had been driven by changes in retail oil and natural gas commodity prices. EGNB does not believe that the proposed changes in the formula

will lead to an increase or decrease in the volatility in the rate classes as the rates will have the same dependence on price movements in the commodity markets.

8. The Commodity Cost estimates for LFO and HFO classes are based on EVP, while all other classes are based on EUG.

**Public Intervenor  
Interrogatory No. 16**

**Reference:** Calculation of the Formula  
Potential Variability of Assumptions With Respect to Electricity-Based Rates

**Interrogatory**

For each assumption used in EGNB's proposed formulae for electricity-based rates, please provide EGNB's best estimate of the potential variability of the assumption in question. At the very least, specify the following for the Derivation Table - Electricity in Schedule 2, Page 4 of 4.

1. What is EGNB's best estimate of the potential variability of the Alternative Energy Cost used in line 1? Please address both how much an individual customer's energy price might differ from the class average and what the variability of the retail energy price itself is. Please express the variability of the retail price itself as an annualized volatility. Please distinguish, where appropriate, between the variability for existing EGNB customers and variability for potential EGNB customers. Please also distinguish between those customers who take (or would take) service from NB Power as compared to customers who take (or would take) service from municipal providers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

2. What is EGNB's best estimate of the potential variability of the Typical Natural Gas Consumption used in line 10? Please address how much the Typical Natural Gas Consumption for an individual customer could differ from the class average and what the degree of error is with respect to the accuracy of EGNB's estimate of the class average. Please distinguish, where appropriate, between the variability for existing EGNB customers and variability for potential EGNB customers. Please also distinguish between those customers who take (or would take) service from NB Power as compared to customers who take (or would take) service from municipal providers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

3. What is EGNB's best estimate of the potential variability of the Commodity Cost used in line 12? Please address how much the Commodity Cost for an individual customer could differ from the class average and what the degree of error is with respect to the accuracy of EGNB's estimate of the class average Commodity Cost. Please also provide EGNB's best estimate of the annualized volatility of the Commodity Cost by customer class. Please distinguish, where appropriate, between the variability for existing EGNB customers and variability for potential EGNB customers. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

4. Please provide EGNB's forecast of the annualized volatility of the Target Distribution Rate by rate class. Please explain how correlations between the formula inputs were accounted for in arriving at the estimate of the volatility of the Target Distribution Rate. Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

5. Please provide EGNB's calculation of the historic annualized volatility of the distribution rate, by year and by rate class. Please compare and contrast the historic volatility to the forecast volatility. Does EGNB believe that the proposed revisions to the formula will increase or decrease volatility for each rate class? Please provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

If EGNB does not have this information, please explain why. Include in your explanation, a justification for the continued claim of targeted savings for existing and prospective customers. Provide all documents, workpapers, and reliance materials related to EGNB's opinions on this matter.

## **Response**

1. Because of the manner in which electricity prices are established there is limited volatility in the retail energy price that underpins the alternative energy costs. Saint John customers will see some variability to the extent that Saint John Energy electricity rates differ from those of NB Power and individual customers will experience variability depending on their consumption patterns. The extent to which their base electricity consumption varies from the assumed plug and light load will influence the consumption that would otherwise have been billed in the first or second block of the electric rate structure. Customers with less plug and light load will experience higher alternative

energy costs and those with a higher plug and light load will experience lower alternative energy costs.

**Public Intervenor  
Interrogatory No. 17**

**Reference:** Calculation of the Formula  
MJ Ervin Report

**Interrogatory**

1. Please provide all data reviewed or relied upon by MJ Ervin in the development of its report. Please provide the data in Excel spreadsheet form, where available.
2. Please provide a list of jurisdictions in which MJ Ervin has worked on the development of regulated rates for natural gas delivery service. Please describe each assignment and specify the dates during which the assignments were carried out. Please provide a copy of the work product produced in association with each assignment.
3. Has MJ Ervin ever worked on the development or implementation of a regulated market-based rate for natural gas delivery service? Please specify those assignments listed in response to 2. above which addressed market-based pricing for natural gas delivery service.

**Response**

1. Table 1 summarizes the data reviewed and relied upon by MJ Ervin & Associates in the development of its report. This data is provided in an Excel file titled Distillate Fuel Price Forecast.

*Table 1: MJ Ervin & Associates Report Data*

<b>Data</b>	<b>Source</b>	<b>Methodology Notes</b>
<b>US\$/CDN\$ Exchange Rate</b>	Bank of Canada	Noon rate
<b>WTI Spot Price</b>	EIA (Energy Information Administration)	
<b>No. 2 Oil Spot Price</b>	EIA (Energy Information Administration)	
<b>Saint John Furnace Rack Price</b>	MJ Ervin & Associates	Imperial Oil and Petro-Canada rack prices
<b>New Brunswick Retail Price</b>	MJ Ervin & Associates	Weekly telephone survey of furnace oil marketers
<b>Residual Fuel Oil Spot Price</b>	EIA (Energy Information Administration)	
<b>Regulated Maximum Retail Price</b>	New Brunswick Energy and Utilities Board	

In the course of preparing this data file, MJ Ervin & Associates has discovered a miscalculation that impacts its recommendation for HFO prices. Exhibit A, Schedule 3, Page 11 states:

*Over the past five years, the NYH spot price for residual fuels has averaged 62 percent of the WTI crude spot price with a standard deviation of five percentage points. While the price relationship is highly variable as evidenced in Figure 9, the WTI price benchmark is the best available petroleum basis. We recommend the HFO price be calculated at 62 percent of the WTI crude price.*

In fact, over the past five years, the spot price for residual fuels has averaged 72 percent of the WTI crude spot price with a standard deviation of around six. Based on this data, MJ Ervin & Associates recommends the HFO price be calculated at 72 percent of the WTI price.

2. Mr. Ervin has not worked on the development of regulated rates for natural gas delivery service. MJ Ervin & Associates are downstream petroleum analysts, and the scope of its engagement relates to its area of expertise.
  
3. No. Refer to response to 2 above.

**Public Intervenor  
Interrogatory No. 18**

**Reference:** Calculation of the Formula  
Usage Profiles

**Interrogatory**

1. EGNB notes on page 5, question 9, that it applies a usage profile. Is it correct that the usage profile is a class wide profile and that the individual customer profiles could differ substantially from the class average?
2. Please provide all data reviewed by EGNB and all analyses performed by EGNB with respect to the question of whether and by how much individual customer demands can differ from the class average.
3. How can EGNB's proposed formula accurately forecast the cost of alternative fuel if the usage profile is not based on that individual customer's demand but instead based on class average demand? Please provide all quantitative analysis that EGNB has performed for low-load factor or high load factor customers in each EGNB class.
4. Is it correct that EGNB used the usage profile of customers who do take natural gas delivery service from EGNB? Has EGNB performed any analysis to estimate the relationship between the usage profile of customers who do not take natural gas delivery service from EGNB and the usage profile of customers who do take natural gas delivery service from EGNB? Please provide all quantitative analysis performed or reviewed by EGNB and its consultants.
5. Does EGNB agree that in order for the formula to provide the target level of savings for a customer who does not currently take natural gas delivery service from EGNB, the usage profile used in the formula would need to be reasonably reflective of that customer's usage profile? If not, why not?
6. Please fill in the table on the next page for each EGNB rate class for customers currently taking service. The percentiles should be determined based on gas demand (in GJ), so that each decile has one-tenth of the gas demand (or as close to 10% as possible), while the number of customers in each decile should decrease from the 91-100 decile to the 0-10 decile. In other words, the customers with the largest gas demand should be in percentile 100, and the customers with the smallest gas demand should be in percentile 0.
7. Please provide any estimates of the demand characteristics of eligible New Brunswick customers that are *not* currently using natural gas. Please provide EGNB's best estimate of the percentiles, number of customers and associated demand eligible (but not taking service) for each rate class in a similar format to the Table shown on the next page in question 6.

<b>PI IR-18 Question 6</b>		
<b>By Rate Class</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>

81-90		
71-80		
61-70		
51-60		
41-50		
31-40		
21-30		
11-20		
0-10		

**Response**

1. The usage profile is a class wide profile and individual customer profiles will differ from this profile.
2. Please see the response to Board Interrogatory No. 4(a) for all of the relevant data related to individual customer demands. EGNB has not conducted any analyses regarding the degree to which individual customer demands can differ from the class average. The intention of the market-based rates formula is to establish rates for a typical customer, where some customers will consume more and others less than the average.
3. The purpose of the formula is to establish a delivery rate that will provide a typical customer with the opportunity to achieve target savings. EGNB believes that a class-average is the most appropriate means of accomplishing this as it is not feasible to

establish a unique delivery rate for each customer's usage profile. EGNB has not conducted any quantitative analysis on low-load or high-load factor customers.

4. EGNB used the usage profile of customers who do take natural gas delivery service from EGNB as these are the only ones that EGNB has usage profile information for. EGNB has not conducted any analysis on the load profiles of customers who do not take delivery service from EGNB, as it does not have access to this information.
5. EGNB agrees that the usage profile used in the formula would need to be reasonably reflective of the usage profile of a prospective customer to provide the target savings if all other elements of the formula are equal. It is reasonable to expect that there will be some variance in terms of the ability to achieve target savings among all customers within a class; both existing and prospective. However, the purpose of the formula is to provide typical, not all, customers with the ability to achieve target savings.
6. The tables for SGSRE, SGSRO, SGSC, GS and CGS are provided below. There are insufficient customers within the LFO and HFO classes to provide meaningful data.

<b>Rate Class: SGSRE</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>
91-100	33	13,236
81-90	41	13,102
71-80	52	13,158
61-70	81	13,080
51-60	106	13,096
41-50	127	13,133
31-40	146	13,171
21-30	167	13,165
11-20	192	13,151
0-10	239	13,117

<b>Rate Class: SGSRO</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>
91-100	123	27,562
81-90	186	27,513
71-80	231	27,539
61-70	273	27,566
51-60	310	27,502
41-50	346	27,574
31-40	382	27,533
21-30	421	27,599
11-20	472	27,519
0-10	551	27,534

<b>Rate Class: SGSC</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>
91-100	27	21,501
81-90	40	20,936
71-80	49	21,280
61-70	58	21,081
51-60	68	21,354
41-50	79	21,092
31-40	94	21,263
21-30	117	21,247
11-20	153	21,152
0-10	267	21,249

<b>Rate Class: GS</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>
91-100	25	65,167
81-90	37	74,283
71-80	46	75,886
61-70	56	75,983
51-60	65	74,898
41-50	79	75,936
31-40	94	75,406
21-30	113	75,442
11-20	135	75,519
0-10	165	75,681

<b>Rate Class: CGS</b>		
<b>Percentile</b>	<b>Number of Customers</b>	<b>Gas Demand (GJ)</b>
91-100	6	90,316
81-90	7	78,995
71-80	10	87,578
61-70	12	88,489
51-60	13	82,971
41-50	16	85,689
31-40	20	85,811
21-30	24	85,418
11-20	29	84,752
0-10	36	85,677

- EGNB does not have any estimates of the demand characteristics of those residences and businesses in New Brunswick that do not use natural gas as it has no access to the information necessary to conduct such an analysis.

**Public Intervenor  
Interrogatory No. 19**

**Reference:** Calculation of the Formula  
Historical Fuel Price Data

**Interrogatory**

1. EGNB has proposed to use two calendar months of historic fuel price data (Page 4, Question and Answer 7 of the Evidence). Does EGNB or MJ Ervin have any evidence that marketers of alternative fuels price their product based on two months of historic price data? Does EGNB or MJ Ervin have any evidence that marketers of alternative fuels price their product based on the current forward markets or the prior day's closing prices? If marketers price their product based on current or end-of-prior day forward prices, wouldn't the use of two month history compromise the formula's ability to deliver the target savings? Please explain.
2. Refer to Page 17, Question and Answer 33 of the Evidence. What is the justification for using two months of history to set the rate, but only 21-days to trigger the rate rider?

**Response**

1. EGNB has no evidence that marketers of alternate fuels price their products based on two months of historic data, current forward markets or prior day's closing as there is little transparency on the means by which marketers establish their pricing. Also, MJ Ervin & Associates has no evidence that marketers of furnace oil price their product based on current forward markets or end of prior day forward prices. The only transparent information that EGNB is aware of is the manner in which the Board establishes the maximum retail furnace oil price. This is based on 7-day price average.

To the extent that marketers of alternate products establish the pricing of their products on a different basis than EGNB, there is the potential for the formula's ability to deliver target savings to be compromised. It must be noted though that marketers prices are not subject to regulation, other than maximum furnace oil prices established by the Board. The two months of historic trading data for forward prices are used as a means of establishing the maximum delivery rates to be charged by EGNB, that may only be established once a year. If market conditions change such that delivery rates could increase, EGNB is unable to do so and customers will have the ability to achieve greater than the target savings levels. If market conditions change such that delivery rates compromise the ability to deliver target savings, EGNB may apply for a rate rider to reduce its delivery rates. To allow EGNB to be more responsive in its rider applications, EGNB is proposing a shorter time period for the collection of market data to better align with the application and approval process associated with implementing a rider.

2. Please see the response to AWL Interrogatory No. 1 for the reasons supporting the use of two months for establishing the maximum rates and AWL Interrogatory No. 6 for the reasons supporting the use of 21 days for the Rate Rider.

**Public Intervenor  
Interrogatory No. 20**

**Reference:** Calculation of the Formula  
HFO Class

**Interrogatory**

1. For the HFO class, if it is the case that there is a “lack of price transparency” and “a lack of fungibility,” as cited by the MJ Ervin report (Page 7), why does EGNB believe that a market-based rate formula of the type proposed can work for this class? Does EGNB have any evidence on the effectiveness of EGNB’s historic market-based rate for delivering the value proposition to HFO customers in the past? What market research has EGNB or its consultants performed to determine whether the formula can be effective for customers who are eligible for the HFO rate but are not currently using natural gas? Has EGNB considered any alternatives to the formula for these customers that would fit within the general framework of alternative rate regulation? What alternatives were considered and why were they not pursued? If EGNB were not constrained by the Board’s Orders asking EGNB to continue using market-based rate formula framework, what ratemaking approach does EGNB believe would best suit these customers? Please explain.

**Response**

1. EGNB has historically been unable to deliver target savings to HFO customers as the formula would suggest a negative delivery rate being required to achieve the savings levels. As EGNB has indicated in the past, there are reasons beyond target savings that will drive a customer’s decision to convert. In the case of HFO customers, the reasons for using natural gas are typically related to environmental and/or maintenance concerns.

EGNB believes that a market-based formula remains the most effective means for establishing the maximum delivery rate for the HFO class as market conditions can create conditions that would support target savings being achieved. During the summer of 2008, market conditions were such that HFO customers had the opportunity to achieve significant savings through the use of natural gas in comparison to No. 6 oil. The use of the formula for HFO allows EGNB to monitor when such conditions may exist. These conditions are applicable equally to existing HFO customers and prospective HFO customers.

EGNB has not considered any alternatives to the formula for these customers and believes it continues to be the appropriate rate setting mechanism for these customers for the reasons noted above.

**Public Intervenor  
Interrogatory No. 21**

**Reference:** Calculation of the Formula  
Data Assumptions

**Interrogatory**

1. Please provide all calculations (in spreadsheet form) and reliance documents related to the assumed annual energy usage and monthly profile, base lighting usage, for heating and water heating for the residential electricity rates referenced in Question 16, as well as the monthly profiles shown in the response to Question 4.
2. Please provide the calculations used to arrive at the efficiencies listed for each rate class and fuel type on page 7 of Mr. Charleson's testimony. Please provide all source data relied upon.
3. Please provide details on the "other" products used by each rate class (as seen in the table on page 15 of Mr. Charleson's testimony). What are these products? Do any of them constitute the majority of sales for any rate class? Are prices available for them? Please provide all source data relied upon.
4. Please provide the calculations or sources for the Contract Demand Charge. Please provide all source data relied upon.
5. According to the rates posted on the Saint John Energy and NB Power websites, electricity is roughly 60 cents per kWh cheaper in Saint John, a savings of over 6%. If the alternative energy costs are overestimated for customers in Saint John, would they be receiving the target savings level of 20%? Has EGNB considered using the Saint John price for the customers located in the Saint John service territory and the NB Power price for customers located in the NB Power service territory? Why or why not?

**Response**

1. The monthly profile of electricity consumption is based on the typical usage profile for an SGSRE customer. The supporting data for this profile can be found in EGNB's response to Board Interrogatory No. 4(a). The assumed annual energy usage is also based on this data, plus the addition of the base plug and light load. The manner for determining the heating and water heating load can be found in EGNB's response to Board Interrogatory No. 7.

The 848 kWh/month of plug and light load was determined at the time the SGSRE rate was established. To determine this, EGNB has relied on information from NB Power's web site which indicates that approximately 60% of a customer's electric bill can be related to home heating ([nbpower.com/html/en/conservation/save\\_energy/tips.html](http://nbpower.com/html/en/conservation/save_energy/tips.html)). By

using the heating load and assuming that this represents approximately 60% of the total energy consumption, EGNB is then able to determine the remaining load that is associated with water heating and plug and light load. After deducting the assumed water heating load, the remaining load is assumed to be plug and light load. In preparing this interrogatory response, EGNB recognized that the derivation of the plug and light load should have been updated to reflect the reduction in the typical annual natural gas consumption for the SGSRE class from 114 GJ/year to 111 GJ/year. This would result in a reduction of the 848 kWh/month to 806 kWh/month. The following table summarizes this calculation:

		Calculation	kWh
1.	Heating Usage	Estimated	21,727
2.	Water Heating Usage	Estimated	4,816
3.	Total Consumption	Line 1 / 0.6	36,212
4.	Plug & Light Load	Line 3 – (Line 1 +Line 2)	9,669
5.	Monthly Plug & Light	Line 4 / 12	806

The following tables reflect the correction to the plug & light load:

Month	Block 1 Incr	Block 2 Incr	Base kWh	Electric Heating Usage Usage Profile kWh usage	Electric Water Heater Usage Usage Profile kWh usage	Total Usage	Water Heater Rental	Total Electric Cost
Jan '09			806	19.1% 4,150	9.8% 472	5,428	\$7.34	\$410.30

\* Table shows potential rates for calendar 2009 based on the application of the Formula using market information from November and December 2008. Natural gas consumption is based on 2008 billing data.

2. Please see the response to Board Interrogatory No. 5(a).
3. The “others” column in the table on page 15 reflects the percentage of customers that obtain their commodity from a supplier other than EGNB. This would include offerings by licensed gas marketers and other supply arrangements that a customer may make for themselves. As the chart indicates, this constitutes the majority of sales for customers in the GS, CGS, LFO and HFO classes. There is little to no transparency on the prices of the other supply arrangements that customers make. As a result, EGNB does not have any price data for these supply arrangements, other than anecdotal knowledge of the pricing that some customers have been able to obtain. EGNB assumes that the prices seen by these customers are either lower than those available from EGNB or provide terms and conditions that fit the customer’s needs better than those offered by EGNB.
4. The Contract Demand Charge was established in the original rates proceeding (NBPUB 299) to recognize that “a significant portion of total costs allocated to these rate classes is fixed, and is capacity related.” (Exhibit B, page 8). The demand charge was put in place to encourage customers “to improve their load factor (ratio of average daily volumes to peak volumes) and thereby benefit by way of a lower unit rate by volume of gas consumed in comparison to identical consumption at a lower load factor.” (Ibid)
5. Based on EGNB’s review of the NB Power and Saint John Energy websites, the posted rates are approximately 0.6 cents per kWh lower with Saint John Energy, not 60 cents per kWh as suggested in the question. This is still a difference of approximately 6%. If all

other elements of the formula were realized by an SGSRE customer in Saint John (e.g. annual consumption, commodity cost) they would not achieve the target savings. However, as with any other SGSRE customer, any differences in their consumption patterns or commodity pricing will also affect the savings that are achieved.

EGNB has not considered using a separate pricing formula for SGSRE customers in Saint John for the reasons articulated on page 10 of the evidence and the fact that it would be counter to the principle of postage stamp rates that was included in the proposal accepted by the Province in granting the franchise rights and the rate design concepts accepted by the Board in EGNB's original rate proceeding.

**Public Intervenor  
Interrogatory No. 22**

**Reference:** Interrogatory Responses

**Interrogatory**

1. For all of the interrogatories, IR-1 to IR-21, provide the name of the individual who has answered each interrogatory, or questions therein.
2. For each individual identified, provide his or her title and organizational affiliation. If that individual has multiple titles at multiple Enbridge Companies, please provide all titles held by the individual

**Response**

1. EGNB does not believe it is appropriate or necessary to provide the name of the individual who has assisted in answering each interrogatory, or the questions therein. EGNB will bring forward the individuals it believes are appropriate to respond to any questions that may arise from the interrogatory during the oral portion of the proceeding.  
  
EGNB believes this is consistent with the findings of the Board in its February 12, 2009 Motions Day decision in the NBSO Revenue Requirement proceeding.
2. See 1 above.
