**SECTION 4.0** 

**SEP Test Proposal** 

The economic justification of EGNB's capital expansion program has been a topic of discussion and 1 2 review at the Board for a number of years. In the Matter of a Review of EGNB's Financial Results and Natural Gas Sales at December 31, 2009, a significant amount of time at the hearing was spent discussing 3 potential methods to evaluate EGNB's system expansion spending. Although a number of approaches 4 were examined, a portfolio approach based on a set of defined inputs was approved by the Board. Since 5 6 the Decision dated May 16, 2011, the System Expansion Portfolio (SEP) Test has been used annually by 7 the Board to evaluate the reasonableness of EGNB's system expansion activities. 8 "The Board directs that projected annualized revenue from expansion must exceed cost 9 by at least two percent. The Board may alter this margin in future years. The Board will determine the prudence of expansion costs on this basis. This calculation for the 10 11 prudence of expansion costs is to be included in the notes to the Regulatory Financial 12 Statements." (p. 15) In the Decision to Matter 175 dated September 20, 2012, the Board ordered an adjustment to the test as 13 14 follows: "While the Board accepts that the system expansion test was passed in 2011, the Board 15 finds that the percentage by which revenues must exceed costs should be increased from 16 17 two percent to four percent in future years. The system expansion test will be modified accordingly. 18 19 The Board will continue to monitor this issue to determine what additional changes may 20 be necessary in the future." (p. 6) 21 The SEP Test has been used as the primary test without significant modifications. EGNB passed the test 22 each year until 2016. 23 As the test calculates a ratio based on the actual capital spent on an annual basis by EGNB to expand its 24 gas distribution system and the forecasted annualized revenues for the attached customers in the same 25 calendar year according to the specific set of criteria and inputs, the timing of when the connected customers initiate gas service becomes a critical factor that determines the outcome of the test. When 26 27 EGNB evaluates the feasibility of an individual project on its own merits, timing within the calendar year 28 cannot always be managed. 29 When a large capital project is undertaken by EGNB in a calendar year and is simply energized for a single small customer or for the supply of construction heat instead of for the anchor load that justified the 30

original decision to proceed with the project, an imbalance in the SEP Test results will occur as the impact of the large capital costs are not properly matched with the revenue from the anchor load originally anticipated. When EGNB evaluates the underlying economics of an individual project, it evaluates all the incremental costs and revenues to be generated by the new customers who will be attached. EGNB then makes the decision whether to proceed, request from the customer a contribution in aid of construction, or decline the customer connection request. Although customer attachment timing is a consideration, EGNB's economic justification for a system expansion project is primarily determined by using all the costs of a project and all revenues from customers reasonably anticipated to initiate gas service (including contractually signed customers) at the time the project is evaluated. All other customers attached after the project is undertaken are considered "bonus" customers, which adds real economic value to the project and to all customers served from EGNB's gas distribution system.

In the Decision to Matter 371 dated December 13, 2017, the Board stated:

"If EGNB wishes to propose modifications to the Board's method of evaluating the prudence of expansion projects, it should file a proposal in a future application." (p. 4)

As a result of these potential timing issues, EGNB is proposing a modification to the SEP Test. As the SEP Test has been vetted and examined in detail for many years, EGNB does not want to abandon the test altogether as the calculations and inputs are clearly understood. It simply believes that a modification is

in order to allow for timing issues.

EGNB proposes to continue using the current SEP Test with one change - using a 3-year rolling average of incremental capital costs and revenues associated with its system expansion activities during each 3-year period. Each year, EGNB would prepare the annual SEP Test as is typically calculated with the usual cost and revenue inputs. EGNB would also provide a 3-year average computation for the latest 3-year period. If the SEP Test results based on the 3-year average was at or above the 1.04 level, the Board would accept EGNB's capital investment for system expansion purposes for the most recent year as being reasonable and economically justified. This approach would maintain the integrity of the existing SEP Test and would accommodate and minimize the negative impact of the mismatch between the incremental capital costs and revenues associated with EGNB's system expansion activities created by the time lag in initiating gas service to its newly connected customers. Better matching of revenues to costs is a sound accounting and economic principle as agreed by Mr. Robert Knecht and cited by the Board in the Decision to Matter 371:

"Mr. Robert Knecht, in evidence filed by the Public Intervener, agreed that EGNB's revised method of matching revenues and costs is a sound accounting and economic principle" (p.4)

- If the SEP test result based on the 3-year average was below the 1.04 level, the Board could consider the particular circumstances and determine if the capital investments were, in any event, reasonable or economically justified. If the Board believes a disallowance is still warranted, the disallowance would be sufficient to bring the 3-year average to a passing score of 1.04 and the disallowance would affect the final year of the 3-year period.
- 9 The tables below present the SEP Test results using a 3-year rolling average for 2014-2016, 2015-2017 10 and 2016-2018.
